No 1

Mechanics

1 sufficient time and a sufficient to
exert his machinery in, had been
given to Archimedes, could he have
found matter of which he have
made levers large enough to
move the earth? — As the tendency
of every body to breath by its own
weight, increases in a higher proportion
than the strength of the body,
the dimensions every given, it was
impossible for Archt. to find any
material of his globe fit for
his purpose, the lever would fail
to perform by its own weight long
before it could reached the necessary
dimensions —

2. What is the proper angle for the sails of a wind Mill? Is not Emerson's determination wrong? — The best method of ascertaining this is by Experiment — Let a large model be made with moveable sails — Place two of-ficials with the same angle and the other two at different angles and observe attentively the Strain which produces each angle — The Sails on which produces the greatest number of Revolutions?

3. What proportion is there between the velocity of a body moving over a plane, and the pressure of the body on every point of the plane?
— A boy can slide over a piece of ice which will not bear him when standing on it —
— Newtonian Power the Canonical —

4. When a body is struck in a line not passing thro' the centre of gravity how is the ratio between the velocity and motion forward determined?

5. Is not the supposition of bodies being composed of particles, ideal? may not all bodies be considered as continuous? cannot a body be divided any where?

6. Why does the Diameter wheels vary
wheels Diameter?

7. What Proportion Dog the wheels
require to Draw Wheels of Dif-
ferent Diameters over the same
obstacle Bear to the Diameters?

8. In a cart or car when the axle
turns with the wheel the horse or
Less strikes them when the wheel
turns on a fixed axle, because when
one wheel is suddenly stopped the
other is stopped at the same instant

9. A cart or car when the axle
is fixed is turned more easily
than when it is moveable, because
the wheels Describing circles of
different Diameters one must

10. If a water wheel 12 feet in Diameter turns round in 5 seconds in how many seconds will one of 24 feet turn round, every other circumstance remaining the same?

4. Why does Oats mixed with Beans give Bread of a yellow colour & not resemble Wheat?

1. Does a Water wheel move faster in the night than in the Day?

2. If the Axis in the Centre be proportionate to the quantity of matter why is a Body suspended like a Pendulum more easily moved when on a horizontal plane?

3. In Cart or Waggon where a number of Horses are yoked if one is spirited he does more than his share of the work and is soon brought out.

14 If a wedge of hard wood is driven into a Mortice in the middle of a Beam which bulges downwards the Beam will be raised proveded the wedge enters from above and the Mortice is somewhat narrower above it should be so to the wedge fleam below —

15. A clock Pendulum was found by Experiment to Vibrate in the least manner when the arch is 25' quite than the angle of the ascent —

16. The Pendulum string of a Clock need not exceed an inch in length when the Pendulum is at rest below the flame of a candle or it will be blown this is said to be a great improvement

W. Arnold

7. How do compound pendulum
vibrate only of this kind, three
feet and two inches? Why
of a metal compounded of Brass
Silver and Bismuth, the expansion
of which is much greater than any
single metal —

8. The pendulum, both of a clock
should not be suffered on its
own edge nor on either its centre
of Gravity or Oscillation, but on a
point between these two centres
Dr. Hutchyns —

9. What is the best method
for making a watch go when
she is winding up?
How are the effects of friction
and collision compared together
or what proportion does the mo-
mentum of a body falling from a
Lever

given height than to the pressure
when at rest?

21. If the pendulum of a clock has
lain for some time in a hori-
zontal position, it will gain in
the first vibration
22. When a pendulum is affected
by clock work it goes faster than
when single
23. The increased pendulum is
moved by Mr. Graham
24 Irregular pendulum by Mr
Harrison, this (pendulum) by Mr.
Graham — The theory of this
pendulum must be determined
by experiment — Variations in
the expansion of the same mat

25. When the pendulum hangs by a spring the centre of motion is perpendicularly changing and occasions a motion with and down in the cycloid — This would be remedy this by substituting the pendulum on a diamond fixed in a block of wood, a groove through the upper part of the pendulum will act on the diamond

6. It is impossible for gravity to regulate a motion equal to a long pendulum — — improvements in watches —

Theory says that the force requisite to draw a wheel in the different ratio of the axle to the wheel — has not been found by Experi-

~~Some Engine Lever Lower Pump Rod~~

28. A wheel is a (disadvantage to
be called wheel, M. M— (second to
be a case his Examiner will
would not be made to perform
above 80 revolutions of the wheel
in a minute, but after
having a way the case and steam
can included) steam below, he obtained 130 revolutions —

29. Whether wheels should not be
used where there is a scarcity
of water

30. By inventing any combination
of pulleys it may be proved that
the lesser pulley gives no mechanical advantage —

31. How can matter be said to be in-
active when it exerts so many actions
& resists by its solidity, solidity is the
effect of cohesion, and cohesion depends
on attraction, and attraction the effect
of activity

2. In any system of mill work
Cog and Cog is better than Cog &
Trundle — Friction Less — grain of
the wood in the staves of the Trun-
dle cross — staves gears & Cogs —
— In Trundles it is an inconve-
nient to make the staves turn
on their axis —

The following composition will
greatly diminish the friction of
wood on wood — into a quantity of
oil stirred on much black Lead as
will reduce it to the consistence of
Cream paste

should seek add a small quantity
of this wire to give it consistence

34 A F. Leg should move through
about 32.4 feet in a second accord-
ing to Ar. Gr = x

35. In Loxi Museum the Streams
of light were made with rods of
curved glass leaving an axis
— Ring and Lace —

36. A Worm must go both round &
should be at least 10 Inches
broad and very heavy. The Ring
of the circle should be smooth
the whole with Plumbago, as a
Mould —

37. A body pushed or drawn over
on the circumference of a roller
moves Through double the space that
the roller moves through —

28. If two pieces of wood be planed clean
and flat and a piece of blotting paper
touched in weak glue be put between
them, they will adhere with sufficient
power to allow them to be turned
or raised by any figure. They may
26 afterwards be separated without injuring the other. This is very useful
in making the Cornice sections and
many other mechanical contrivances

9. The best length of a Pendulum
Crutch is about 15 Inches and
should be made of hard steel to
prevent as much as possible the
expansion —

0. In the Pendulum Pendulum no
correction is introduced for the
Crutch —

41. What is the best method of proving the accuracy of the Gunter's Chain?

42. Chain Jumpers are of the same dimensions as all the rules but is 6¼ Inches less. The Chain has a greater number of Joints to their size from 1 to 8 — Most have hand Jumpers

43. Much Trouble is lost in the Chain Jumps at 20 feet, 20 rules are required) to work it properly as the quantity of work does not exceed one Chain & Rules. It would also ruin often out of repair — late improvement of Mr. Colhas rendered the locking of the Joints more easy than formerly.

No 2

Mechanics

4. Cole's improvement on the hand pump consists in placing an opening below to take out the lower piston without drawing the upper or moving the pump

5. The patent pump has both pistons moveable the rod of one passing thro' the center of the other. It is said to raise twice as much water as the common pump

6 Suppose a chain pump raises 1 Ton of water in a minute Then the Chain of 23 Inches Diam. must turn 26½ times, consequently in length of Chain equal to 165 feet must pass to give a Ton. 15 Gallons are displaced by the Chain. This

[illegible] cannot be ascertained without
drawing. If there is above 3 feet w
in the well-hole —

47. A pump is with three pistons fi
to a box which medians three dou
valves will make a continuous sh
of water and raise it as far more
than the chain by the same no. of
hands — model —

48. Water mills are in use among
the Romans. The remains of one
was lately discovered at Rhaudha

49. Machine for making combs
It cuts all the teeth at once —

59. What is the principal advantag
of steel pens over common pens?

60. In what manner attraction & Rep
is the velocity expended by the expl
in lower animals? — Lower —

Dimensions of Carding Machine made on a Scale of 9 Inches to the Foot

	Ft	In
Diam^r of the Large Cylinder	2.	2
Ditto Ditto —	1	7 1/2
Length of both ———	1	2
Length of cards on the G^t Cyl^r	1.	——
Breadth of Ditto —— ——	0.	3 1/2
No of Rows ———		
Distance of cards ——	0.	1 1/2
Two Bevelled Tooth Wheels on the Axis of the Great Cyl^r the other on the iron Shaft no^o of Teeth in each ———	}	14 Teeth
Two Wheels for the endless Screws on the Oblique Shaft	}	40 Teeth
Pulley on the Shaft of the Great Drum —— ——	}	0. 8 1/2 Diam
Ditto on Upper with three different grooves ——	}	0-6 ——

nine Tenpenny cords at 2 Inches each	1	6	
Spiral cords on the Lower Cylinder 7 breadths Long With Two Tenpenny rollers Between which one Guide Pin under Each weight hung on Each End of the upper roller — The Cloth rolls of wood	0	1	1/2 cwt

n

An instrument for ascertaining the
Density of the water moved by the
Screw, (Inventor Mr Smith of London
its Truth

2. The sowing machine of Mr Wright
cotton mill &c. Two Pounds ten
pounds 5 to 1.— with and without rollers. In this
as in all the other systems the
front rollers is usually made larger
than the rest Perhaps this
Name must be attended to in
the trial

Machine for weaving Ropes Twine &
3. Machine for shearing cloth
4 by the motion of the Ship
— Lord Chancellor —

65 Robert Blow Jr warming a wo
with an Iron Pan that of the
atmosphere — Curved velvet wh
Rubber Tube — metal —

66 Durkee Mathes blow pipe a-
paratus consists of two small do
pair of bellows connected with each
other, between which are two wo
valves so hinged as to open in one
direction only & shut with re
spect to the other — Pipe is on the left hand side
and has both a vertical and
horizontal motion —

67. Rotative motion may be produ
by two which on the same axis
both move on the axis, both
each other one shorter, valved wh
from on the other two blows, & Dow
ward, both not directly upwards, bu

distant the thickness of the thick
teeth of both sides of the teeth in the
thick at the other end ——

8. If two springs could be contrived
of the same strength and equally
affected by heat and cold. Then yet
a double watch be made to go
should direction the mean time
to the true ——

9. If a pendulum rebates in
proportion to its length will not
any regard to weight, why
should a diminution of gravity
produce a slower motion at the
Equator?

The Thermometer affixed to the
new Chronometer can now pro-
duce their effect unless the

Watch was regulated previous to
the application of the Thermometer

71. It is assumed by some Clock-
makers that soft Mallets will work
longer than hard ones.

72 Some Clockmakers make their
escapement such that the Pallets
of some Mallet Staffs when produced
thro' the Centre of the Arbor

73. The Mandrell of a Lathe for
holding Cutters is of Steel 2 in
Cutter of Two Cutters wear long
11/160 revolutions & minute
— It is a foot Lathe — wheel 3 1/2 in
in Dr. Studley 1/2 Inch Wheel of
the foot wheel 180 & Pinion

4. A new method of conveying a
circular rotary ~~motion~~ motion
exhibited at the Royal Society
9 June 1787. — This is performed
by means of an Elliptical groove
on the surface of a Cylinder —

5. Method of supporting a horizontal Shaft on friction Rollers
— Marine Barometer — How to
boil the mercury in any part
of the tube without risk of breaking
it — Clock with one wheel, shewn
10. Hours and Minutes

Circular plates of the same
thickness are equally strong
whatever be their diameters.

78. Nailing machine for belows
a small cylinder of steel with
a handle, held a little obliquely
like a turning tool—

79 Best wrench for fixing chucks
on the Lathe a circle with
a small edge corresponding to
to a groove in the chuck—

80. The wheels of turning lathes
should be made of cast iron
with axes with cylindric not
conical gudgeons. The latter
act as a wedge and greatly in-
crease the friction—

81. The common mode of comparing
the effects of a Battering ram and

cannon tho' mechanically true
is not just when applied to practice
the slow motion of the ram is an
advantage —

2. The principal advantage of a
hydraulic
fall pump for a water is that
it does not rust — gun is not
the fall mixed with iron other
metal? —

3. Machine for washing gauze
lace &c. —

4. Weight Lathe for turning cones
or any moulds for buttons —

5. A machine for drawing Epicy
cloidal teeth for large wheels

6. In what proportion does the resistance
of the air increase :: height

87. Does not Borkowski's Theory lead to this that motion is inherent in matter?

88. It is asserted by Millar that a watch should move with greater velocity during the night than during the day — If so prove the cause —

89. Will the balance of a watch be affected by the Earths motion in different Latitudes similar to that of a pendulum? Will the watch go slower at the Equator?

90. The wheels of the Roman carriages (were exceed) 2½ feet in diam. the Roman shewed great skill and ingenuity in their Fortifications, is not this a presumption

that they were right in the use of their wheels? — Should wheels of this use be introduced what a great saving both of iron and wood! —

1. The invention of the balance is attributed to Astrea, the goddess of justice, always represented with scales in her hand, the instrument was placed among the constellations — reason — The Astrea Romana is mentioned by Aristotle under the name of Rhadamys. Balance — Libra — with regard even early and hence Aristotle mentions Zygostatai or officers to look after the balance — could abuse — The Jewish Standards were kept with great religious ceremony in the Sanctuary and the care

committed to the Friends and Lov
92. The invention of the Lyre is ascrib
to Nephtune and is represented by
his Trident. In Greek both are called
by the same name Enosis Mochlos
The Property of the Lyre W:P:d:
is mentioned by Aristotle in his
Treatise on Mechanics — Archimedes
— Vitruvius — Aristotle calls the
Lyre Myhomachion, Vitru-
vius Nefolio, Ubaldus Julian and
and Dan: Barbarus Scabellum.
93. The axis in Anatochia is by
Aristotle called Amos —
94. Two Pullies above and two below
called by Aristotle Dispantos, three
Trispantos — Latin Coehlea Pulle
95 If it not equally reasonable to demand
& definition for rest, as for motion,

The Sonnes Sun never been attempted
why than the Latter? —

6. What change Latter takes in the
vibration of a Pendulum when the
point of Suspension is higher than
the Ballet?

7. The Chariot to go without horses
was invented by M. Richard & Dy-
vician at Rochelle and was exhibited
at Paris more than 100 years ago.
it is described by Gyraldus
Recreations Mathematiques

8 Carriages to sail on Land by the
wind on and to be propelled with oars —
Wheelbarrows with sails —
Same —

9. Two Sympathetic clocks should
go and stop alternately —

10 A clock is best regulated by a
screw at the point of Suspension this
may be done without stopping the Clock

101 The velocity of a body may be encreased to such a degree that the friction will thereby be demonstrated - the consequence will be time to drop into the receiving

102 If attraction be handfull in many cases there are some in which it is unfruitfull - Files - &c - &c

103 A Gun discharged on the water or from one side of a river to the other is said to carry a ball not so far as on land, owing to the resistance arising from the waves of the water - This is a vulgar error arising from a wrong estimate of distance ~~stated~~ on water, which to a landsman always appears less than they really are ——

No 1

Instruments

1. Mr Culloch's small Instrument
for laying off right angles consists of
a brass cylindrical box with a fixed
mirror fixed at an angle of 45°
with the sight vane

2. A new flesh brush with short
cork and leaden balls added
to the shaving machine

3. The balls added to the instrument

4. In D. la Rive's pump the water
runs both by the ascent and descent
of the piston

5. Dr Franklin's said to have been
invented by D. Ibi. (I have since found he
(N. B. was mistaken, it was invented by
a common Cutler carried in Paris
6. Eff. of the Double smoke jack
much improved

7. Martini Aspharadus for calculating
the Phenomena of the Transit of Venus
in 1769. extremely well adapted to
ye Equinox — Venus —

8. Haw's Air pumps cause the
Values without the aid of the
Spring of the remaining air.

9. In a rolling Jack the smaller the
rollers are, the better — Small rollers
may be inclosed between large ones

10. In Fingerson's Paradox the fixed
wheel has 39 teeth. The Middle
Thick wheel 39. The endmost of the
three on one axis 39 The Pinion
the Part of the Earths axis. The
middle wheel has 37 This causes
the moons nodes. The upshoot
44. This goes forward and causes
the moons apogee. Short
Jan returns the Nodes revolve in 18 yrs
and 225 days, or the Inclination in 18½ yrs

The Magazine in volume revolves in
on Box
0 312 ; in the machine in 0 4/5 Gear
The Bar. of the axis is fixed in
the machine.

Electric Powder Magazine compound
of Brass Jaws with hinges, may be
blown off either with G. P. or inflam-
mable
Air. 1806

Zinc Wheel — Iron Glycerine
Inlet Cover — Inlet Valve — Rope
Pump — Thunder Cover Mortar
with a bladder tied over it — Dan
mills — Pallets — Albion Mills — Organ

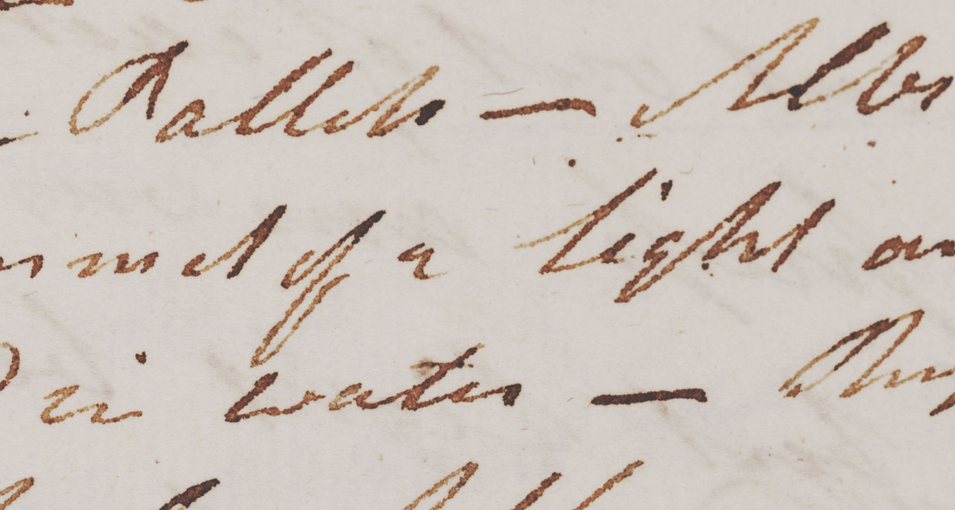
the Sheeting Table —

Screw cutter for Gas Organ



by This Inst. the ⅓
turn is ascertained
by adding more to the
weights to the bellows

Base of the Bellows
Index A is required

Index B fitted to the cen-
Three inches of water in the
For any Index of Gas Organ

14. Scale for the configurations of Inhibits Satt:

15. Whether it is a quest. or small dist: of the sight Vane from the horizon Glass least liable to error in the Instant:

16. By a good Instrument and Watch the Long: may in general be found to within 10 or 15 Miles

17. A circular Saw for cutting out wooden Tubes for Telescopes — Three or four Tubes cut out of each other

18. The cutting Tools answer for heavy work but a little lighter belts done with the hand machine

19. What is the best form of a pair of bellows for a Forge Furnace?

20. The Divisions of Gunters and other Scales are made Black, by rubbing

the Scale, when finished with Temp.
Bath. ——

21 Various Alarums —

— Contrivance for keeping a hot
22. house always at the same temp.
— will give notice to the neigh-
bourhood when the fire is neglected

23. A pump to raise water by fire
— air rarified within a cask —
— by

24 A short Thermometer tube is fre-
quently to a long one, the pendulous
pressure causes the ball to change
its Shape, hence the mercury stands
lower when the Thermometer is in
a horizontal position — Mr. Bennden —

25 Mr Lafridans wheel is a simple

instrument — For Scales of all sorts
a Leaden Polishing Slate with Emery
is used. The Stones in Scales are fixed
on the end of a Steel Rod, and the
different Surfaces are ground without
other rule or measure

26. Lines of the Stereotypes made use
of in the Philosophical Jin worth
are wound with Wire for protec-
tion to prevent the ~~colour~~ heat of the
fire while the Blades

27. are of Doctor De la Roche an
instrument for measuring the
angles of Crystals

28. Steel and Glass for Writing pens
in Vacuo —

29. A Dividing machine exhibited
in a wire case —

30. All the Electrical machines
have been in Paris are constructed
with Cylindrical Plates —

31. In Germany & Holland instead of
the Plates have an Electric Disk
above like the old Turning loom
in Scotland. Those that have
wheels have the wheel above
the lathe — turned as in England
by the foot —

32. Swords are made of Malacca for
the blow fish and sold in Paris
for three Crowns —

33. Gun for shooting Arrows —

34. Apparatus for producing air
from coals

35. Apparatus for Shifting a Belt in
Vacuo —
36. Instrument for Shifting Fire in
Vacuo —
37. An Improved Dividing Engine. Surgeon's Saw —
Sawing Engine — Different kinds
Drills — Machine for making
Chains an excellent contrivance —
— Clothing frames several sorts —
Cloth of different colours woven on
this machine — Silk mill
this Chains made by the machine
are new Cloth for Dresses and
Linsigns
Handles — Machine for reeling
and twisting — Cotton Machine
a Spinning frame — Roving frame
and Carding Machine, These not

of the latest and best construction
— Double Crane with contri-
vance for shifting in or out the
belt and Quadrant for weighing
the load as it ascends or descends
— Oil Engine by Lewis Atkinson
motion like that in a Saw mill
— Machine for trimming & stamping
Watts' Cotton machine — Steam
Can & Dredging Engine — Electric
Engine — Machine for working
wire cloth either back or new
— Barker's machine whatever way
the handle is turned — Machine
for tearing wool, cotton machine
is the hand —— Spinning whole
& different construction — Shear-
cutter — Machine for making
which invented many years since

in Germany. Lately moved in
Birmingham — Paris 1704

38 The right Jurisdiction was invented
by a Nobleman carried in Paris. The
Double Cane by the Queens dancing
master

39. Weights suspended in a box
which a common ruff box the lid
and bottom of Glass not quite filled
with water — a thread with a piece
of cork at one end, and a small
ball of wax and Scotch Reed at the
other or Rosin end. This does not
touch the bottom — Cork suspended
by thread

40 A Thermometer should have a
small quantity of air left in the tube
to prevent the separation of the

41 A Thermometer may be made by balancing the tube on its centre of gravity at the medium temperature — when the temperature increases the last Thermometer will rise —

42. An alarum may be constructed on the same plan as the above.

43. One in the Alarum the Thermometer tube may be placed nearly perpendicular, the upper end of the tube open & small Platinum wire one end of a bel: the other end connected with the detent, when the heat of the room increases the mercury flows over the tube into the bucket and depresses the bel: detent disengaged —

44. A Globular body for a Barometer?
is preferable to a flat one, as the
latter being more liable to be broken
cannot, consequently, be made so thin

45. A Thermometer may be made of
two bars with an axis. The two
bars compose the arms of a balance
one made of a metal the most affected
by heat, the other a substance the
least. Balance the instrument
at a medium temp.? In all other
states of the atmosphere, the Equil.
will be destroyed and consequently
may ~~be~~ have a scale fitted to it

46. A hole made along the equal
part of the frame an imperceived
current of air —

47. A Short Barrow which takes
the exact Shot of a Gun by going
round it — Sort of Pantographic
Instrum —

48. Machine for making Nuts of
Phosphorus — Glass Jars Bottle
Neck Neck Tube — Valve &
Receiver and —

49. Air Bubbles of Spirit Levels
Short Long, Short and Broad
not so sensible —

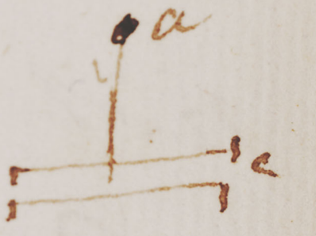
50. Circular Gunter by Margaret

51. Instrument for Drawing segments
of Circles to a large radius / Diam
2 Inv rollers on a ruler, one a little
longer than the other

52. Instrument for Large Angles —

453 Machine for drawing parallel lines
continuous for moving the triangle
forward, for pushing the drawing
paper always at the same angle
— making double lines each
other inside to be filled into one with
4 aqua fortis M. L — 4 —

54 Is it not probable that coal
has been peat once that peat
vegetables? Some
nat. is soluble peat
Bitumen peat hard and heavy resembles
coal.



54 Lacca without a fluid —
a fund of suspension &c. &c. Linseed

55 Given any number of
wheels with their respective
number of teeth, and the wheels

being to Direct that the first,
Lines the 2, the second the 3 &
Required Num. Number of Rods
of the 1st Sheet to bring the
2d and Last Sheet to the same
position as at first, also the
No. of Rods of the 2d Sheet to
bring all the Sheets to their 1st
position

4th Multiply the Length of the 1st
the Num.r and of the Last
Sheet the Num.r of a Width
Section & Divide to Lowest Term
the Num.r expresses the Number
of Rods of the 1st and the Mid

Rule 2nd Find the Least Number
to bring the 1st and Last to the
first Position

2nd For all the intermediate
(Divide the Least Common
Multiple of the Leaves in all
the wheels by the No. of Leaves
in the 1st. The Quotient is the
No. of Revol. of the 1st
wheel to bring Leaves all the
Wheels to their 1st Position

Exp.

1st — 17 — 25 — 29 — 35 = $\frac{17}{35}$ Leaves
C.M. 06275 / 17 = 5,075 1st wh: to bring
all to the 1st position

Ex: 2

22. 25 22. 35 = $\frac{22}{35}$ sum

Com. Mult: $\frac{3850}{22}$ = 175 Ans

sum what to bring all to the

same position —

Experiments

1. To cut a piece of glass into a circular or any other form — Bind a wire into the figure required, heat it red hot lay it on the glass for a few seconds let a drop of water fall on the heated part of the glass and it will instantly crack and the fracture may be carried round in any direction —

2 — Should newly blown out round pieces crack with a sudden jerk it will frequently be stopped when blowing on it by a sudden

3 A Black mouth & Bluish Faith may (when it can) be made a large mouth and by a few strokes of the knife may be cut as to suit the figure (done by others) —

4 From the weight of a Lobster
find the weight of any fractional
part without dissecting it from
the rest

5. To discover a Good Shilling from
a bad one lay it on a hot
Shovel if Good the Dye will ap-
pear

6 Butter Milk and unslacked Lime
makes a strong cement which
cures immediately

7 Juice of Garlick makes a good
cement but Very ill Smell

8. There is a particular Stone found in Derbyshire or which
if not the Stone it selfe Jar

9. A contrivance for uniforming
Servants in their Relations which
is wanted above

10. A contrivance to make the window
sash down of them others when
a shower comes on

11. When Thunder shower is over
on a hot day open all the
Casements

12. Casements Glass Door Door the
other Glass Door Mill Stone,
when heated rub it against a
Coarse Stuff ready to stop Stuff
it remain over night — Bread
and other Toys are made of this

13. A Mark of air how it blinded
hath much weakned, also weather
through a square Pan a round
hole
A pair of old Silk will dry
~~old dry~~ room in a store room
than when a current of cold air
is admitted, the room with out Dust

which will dry worms in the
cellar than in the Garret ——

15. The Day 19 June 1704 a Ballo
6 Inches in D. was Hailed and
Hoaled at Mr. Amorys — Walnford
It Rest at sweet Poms ——

16. In couching the Cattarack the
incision is made in the corne
on the outside of the eye. In exhau
the incision is made in the lower
part of the Iris ——

17. Mr. Regan of Geneva has
letters a Patent for a Lamp
when a current of air passes thro
the flame. ——

18. If a bit of tinctured paper be held
cross the flame of a candle it will
be found that there heath only where
are in contact with air as well as
flame burn. ——

9. I hope may be made to circulate over the same part of a piece of wood / till the wedge takes fire —

10. What wood do the Indians make use of to light their fire by friction and what is the manner of performing the Experiment? —

11. The Chinese turning loom or Lathe —

12. And how even plunged into spirits of wine will not set them on fire

13. Ignis of iron feels hotter to the touch than the surrounding water

14. The smaller the bellows the more powerfull the blast — the reason.

15 On the common Hydrom. thermometer of the Therm. will rise the Mercury, alter the strength or Cent. —

26 May not a sucking pump or
syringe in the inside or forcing
pump above be applied to the
diving Bell? —

27. Shooting stars burst in fine air
give a very brilliant light —

28. A Fly can't walk on a Looking Glass
with a Sloth or a Golden Fly
with Instant air produces a circle of fire
— Oct 1786 —

29. What is the reason that a leather
but always tends to the bottom
part of the Drum?

30 The waving motion of a top is
owing to the Points' being round

31. small light ships may be
wrought by concealed magnetic
Insinuation of a Navel En-
gagement —

32 May not the effect of burning Lime and Brimstone be greatly augmented by throwing on the fumes a Stream of Air by Pneumatic Bellows?

3. Dancing Balls Shields &c may be made of Pasteboard Large Ladies Electrometer —

4. Silver Diamond made by a Solution of Silver in the Nitrous acid, a small quantity laid on a Slip of Glass or Tile laid on the Bench of the Microscope, then May or Mix of Colours or Crystal in the Solution the Same Directions will instantly Regen the Solution must be wash, Dry down with water. —

5 The Silver Diam: may be made as follows into a Glass Tube about 2 Inches in Diam: put a few Drops of the Solution of Silver, Hang

a cotton mill that would
which may be about the size
of a common Cork — In Ireland
Negroes will accomodate to heat.
But a little cotton in Bit Lump
and cut it on one in the inside
of the glove this will make it
better and draw to advantage
the Color

36. Is there any method of rendering
the Starch from hard after it
has been melting?

37. Do the method of manufacturing
Sing Resin or Encyclo.ª Britt.
Ichthiocalla —

38 If the Body or clothes are stained
with an acid, apply an alkali
oil of Potter &c —

3

9. Mix well Red Rattle of bone
is added to the Phosphorus in the
Philosophical Jar Preserve — some
say Sulphur —
10. To whereto Silver from coppers by
a process which does not act
on the copper —
11. Salt Green is now frequently made
from Lettuce —
12 If Mastic Varnish be ground
with Sugar of Lead it dries much
sooner & more solidly than
Gum Mastic — Sugar of Lead or
red Lead — Boil the Lead in the
Linseed oil then add the Varnish
this is called Durability — Transparency
Varnishes are
also Body

43. Vegetable green may be made
of Eau Royale — Marils of Paris
ground with Drying oil — It would
probably answer as well without
the Marils of Paris

44. A Self moving Lamp wheel.

45. A Worm or a Lamp Snuffer may
may be so contrived that no
Lamp will be Lastly consumed
by a Careless Servant extinguishing
some Special Device

46. Why does the Sun Shining on
a Fire cause it to Burn it and it
by rarefying the Surrounding air
Specifically Lighter so that
the Smoke then Ascends
Smoke is heavy —

7. The only red colour which can be burnt into glass at present known is made by melting a small quantity of Gold in Aqua regia with a solution of tin in Aqua fortis — The Colours of Lake Carmine &c fly off with the heat —

— The Authors and englishmen must be of the same opinion however though the other colours will not be good —

8. A silver or gold headed cane black the head or Glove — This is owing to the Cobalt in those metals, which when perfectly pure will not stain

9. (Only those when metaled by a composition put on the inside of a Glass jar — Mr. M—d

50. What kind of flour is composed
with Yeast by adding a little
water — & also light a taper?

51 Mr. Magellan thinks that the
common motion of the sun pro-
longed a little is a vulgar error

52 The Jews owed the Romans with
Usury. They sacrificed the
Gold with oil of Vitriol. This test
has a greater affinity with the ma-
ine acid of the Ag: & than the Hydro
acid therefore the Precipitate
and is left alone. The Gold is precip-
itated in a fine powder — If ano-
ther be precipitated by Sulphate
salts but then the precipitate
will sublimize — This is readily
decomposed with Sulphur.

3. It is asked by Lapidaries if a Diamond may be cut with a Silk Thread —

4. In Melting Diamonds the Dust is made to stick to the Melting ware by oil

3. Diamonds are ground by rubbing them on each other in the hands

5 Noticement of any kind is made use of in setting of stones. Fail it is stated below, to give them Brilliancy —

6. May not a contrivance similar to the Patent Lamp be introduced to prevent smoke?

7. May not Photographic pictures be used for Illuminations?

Paris Sept. 1790

58. In the Palais Royal at 12
o clock a Lunar Iris a small
corona when the Sun shone
Lunar clouds according to the Th. &
59. In the Jardins du Roi a Iris so
bright by a Lunar that Dis engaged
a hammer which shuts 12
clock
60 A method of Electing on Sept.
with the Thun acc. to Jurin
conservation the Officers was after
proceeded and Vill: acc Journ
on it — another Invited is sent
to Lewis Esq Rotch Esq —

61. Was made from the coast by
Dung similar appearance very
whole

Experiments No 2

2. Boil the Roses in Water which is to be used & Alcohol may be Lighted

3. Some Lime ago a man washed over the Lime on his Shop & Paris Sept. 1700 Plate —

4 Cordial coffee with No Sutton and Spirit of wine make a beautiful green Flame — Such with No Vol: Oil and Spirit of wine a blue — Bismuth with Spirit of Nitre & salt gives a Lovely flame inclining to a Lay color. colour — A Solution of blue Vitriol with some Tobacco & Gum makes a green boarding on blue

63. Contrivance to make a window fall down of it self at the beginning of a Shower

66. An Alarum to awaken the Gardener when to take in his hot bed Plants

67. To write the Diamonds out of a ring — Throw the ring into aqua fortis —

68. To make a Gyphen with the hunters sheath —

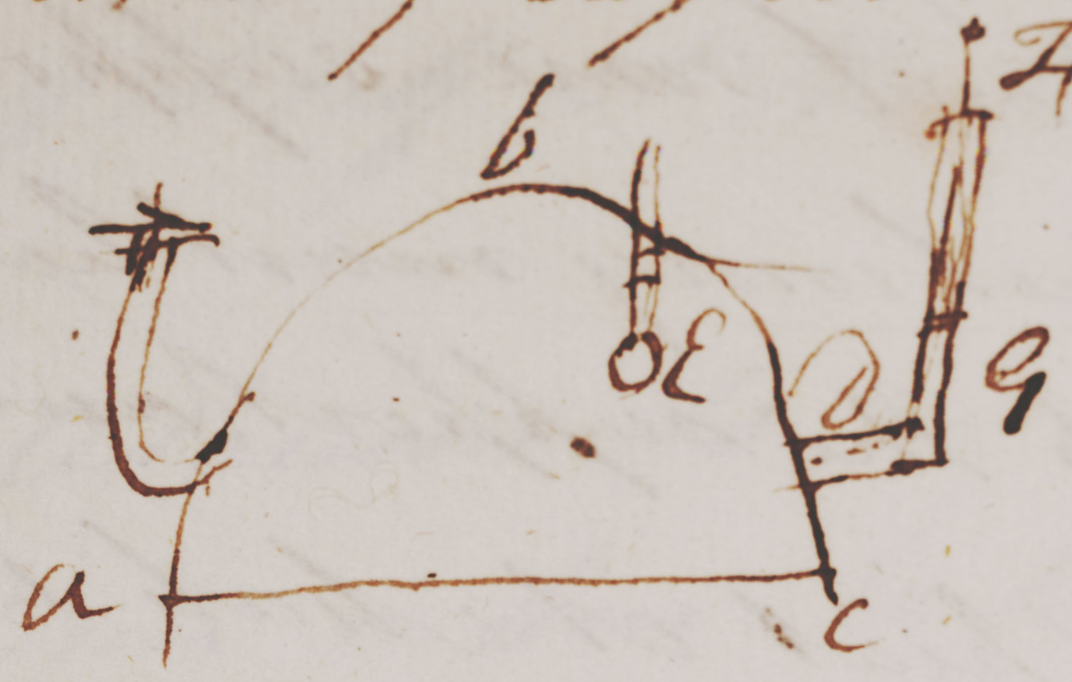
69. If the tail of a Sparrow be cut short with the same care and certainty — ascend and descend what then is the use of the tail?

0. It seems impossible for man
to fly without some support in the
air, the machinery must be sufficient
to raise both the support (and) the man

1. Degrees of heat at which water boils
under different pressures of the Atmosph:

Degrees of Heat	Inches of Mercury	Atmospheres
100	1 Inch Mer.	
119	2	
130	3 1/2	
135	4	
149	6	
156	7 3/4	
192	15	1 Atmosphere
213	30	
236	44	1 7/15
252	60	2
275	90	3
293	120	4
308	150	5

The Table was constructed from the following experiments



a, b c a boiler, D a box filled with mercury. F, G a wooden floating Gauge on the surface of the mercury E a thermometer. The Density of the Steam is measured by the floating Gauge, and the Heat by the Thermometer —

2. Mr. Wall's Experiments prove that
steam produces as much heat from
the heat of boiling water — As steam
from a boiler when immersed in water
transfers heat from one end of the beam
of a balance — The weight of water
from the condensed steam has exceeded
and the heat by the thermometer
By this experiment it was proved
that steam contains more abso-
lute heat than water — & on the
surface of the water with fewest Exp^ts

3. ~~The~~ A piece of whale cord was found
affected as a hygrometer by Mr.
Mr. Holdmeux, the head of the
will) act by Mr. Clark a Lemon
hair by Mr. Jackson and a piece
of whale bone by (D. Lee —
— Guess which is the best? —

94.

Coffeyng Ink of Mr. Wall—

Extract of Galls	3/4 oz
Coffee	1/4 oz
Alum	1/8 oz
G. Arabic	2 1/2 drs
Water	1/2 pint

Dissolve the Gum and extract in hot water: when dissolved and cold add the Coffee and Alum— Leave it two days in air then filter it— Cant it and keep it close corked to prevent the fermentation of the air—

— The extract of Galls may be made thus — Reduce the Galls to powder boil the powder in soft water for about half an hour when cold filter and wash it by

5. Boiling to Dryness —

Powdered for the Ink

Raspings of Brazilwood 4 Oz

Infuse for two or three days

in Strong Pale Vinegar 1 or 1½ pint

according to the Strength of the colour

in the Brazilwood — Boil it gently

for an hour in an earthen Vessel

and filter it thro' Cotton while

hot into an earthen Vessel then

put in again over the fire and

dissolve in it first ½ Oz G. Arabic

and afterwards of Alum and

White Sugar each ½ Oz

— This ink grows while Dry of a deep

the colour may be restored by Boiling

for a short time. The Paper with

the ink may be first put into Boiling

water —

96. How can it made by pulling two
cans into one oblong box
vessel, this is shown in a mixture
of snow and salt in a wooden
bucket

97. Explain the best method of lay-
the basin on a globe?

98. A thermometer in a singu-
ring, consists of three semi-
circular arcs,
two, middlemost turn and the
innermost soften. The two first
all one end by a pin. The other
end rests on a short pin mov-
able about a centre which is mid-
dest to the middle, this is the
pin comes to the innermost by me
of a short moveable piece — The

The end of the Level are then in
~~Hand~~ a rack which moves the
centre pinion ~~to~~ with carries
the Index —

The invention of the above, whereby
a watch may be kept made
fit for Conducting and for a clock

Thus —

a b

Consisting of two wheels
one of copper a the
other b of iron —

79. Gold Beaters leaf is extended more by
the Blows of the Hammer as the
beat by the Stretching of the Skin
which after the Blow Recoils and
and at rest takes its forward —

80 In horse Jury Vaults two
Vitulas there are two draw bridg
at the ends of the boat which
when Pull Down greatly Faci-
litate the entrance and exit
of the horses — A certain con-
venience much wanted in Brita

81 The Rhone is about the Breadth
of the Thames, but much more
rapid. To prevent the Jury boa
being carried away with the cur
a Cable is stretched across the

two blocks fastened each
end fixed to a windlass — a
moveable pulley runs on this
cable to this pulley one end of
the boat rope is fastened the
other is made fast to the boat
between the head and beam
— the position by this means
becomes oblique to the beam
which consequently pushes
her forward — the pulley runs
along the cable by blocks some-
times behind at other times
directly a head —

12. The distance may be varied by
letting a bit of pewter tube
with shallows, on this let a pewter
rod, connected with the detent —

83. An alarm is said to have been
proposed to be made of the alarm
— gun how —

84. would not a contrivance to
turn the Reins in playing
upon the Piano? prevent
the Instrument so long & to
turn round? Two collars would be
better —

85. What is the most Natural me-
thod of pronouncing Two Letters
from Learning?

86. If a Bottle be filled with Legs
Heads & Arms the ornament the
Heads & Arms the bottle. Heads
Heads sets the bottle.

87. Bullets frequently sold in Shop
by weight — Inquire by what

it perfectly cylindrical would
be useful

28. Might not the dust catch be contrived to take out the dirt themselves as they move along the sheet?

29. Some mode of Ayrton should would perhaps answer some purposes better than yours

— ingenious —

30. A large retort filled with steam, made to move along the sheet in the same way, (steam) in the same direction and projecting into the room above the steam, might light a coffee house for a sheet evening and at a trifling expence —

91. Chaos Paint and then the ma
of the Almighty in the Triangle
withdrawing, chaos retires, and
the Solar System appears —
for worth —

92. New Brathwaite is made to
look old by rubbing it over w
lime water — Soft cakes, or alm

93. An alarm against House burg
a Small of Lead at the end of a
Line of Twine the noose at the oth
end of the Twine first in a Spir
in such a manner that in the
the Door the noose is light of
and the Lead falls —

94. Air Pump: or any other Exper
will Take out a Stain of Ink

Soak Lin the oum, but Shi' Lus
si apst to ingue Shi cloth —

5. Lemon juice, or Spirits Salt
of Lemon, or Salt nixium Lest
for Nothing out inth stain
— Sal nixium sold for Eng: S. Glau-

6. A mixture of Starch and Lurdi-
gris makes a fair gream Gum
— Starch itself is very difficult —
when blown out of the Eath makes
a fair Gerbe —

7. Fumes of Shrish brown or oil of wax
will carry a Flame to a consid-
rable Distance — Fri Salt — Sulphur
— Camphr easily wlound with Brow-
Shrown

98. On what Principle is the oven of a watch regulated?

99. If a watch balance be hetd in the fire so as to cause it to swell on one side & run out of shape - would it not be rendered useless?

100 Varnished wood is polished with woollen stone on a cloth and fine with flour - Gum would not fine stick so well?

101. Doctor Priestley proposed purifying by saturating it with - by this operation the radical cause)

No. 3

Specimens

2 Wood stain or Preserving Compo-
sition for Wood. Dirty Stain removed
and
3. Wax Lacquered Brass, and
with Polarine oil on a piece of
Flannel or soft rag —
04 Iron and Steel Work when hot
(boiled) Freezer Room Stairs
when it has not — Hot — Cold —
05. Room Heating Water or Steam Pipes
with — and a Glossy Surface of Slate and
Whiting — Ornaments for Chimney
Pieces — Marble Brackets &c —
6. A Stone Load on the Hand or any Heavy Work
Ready Written, but on any Heavy Load
with Iron a very Good Colour —

107. Will the sun's rays collected in a
lyne melt glass?

108. What is the best method of pre-
venting a carriage coming down on
the falling of one or both lowes?

109. — Ans. Dust getting into the
carriage in hot weather —

110. An oil to burn in a lid chamber
without injuring the eye —

111. Composition for cleaning mou
discoloured with smoke
1 Quart of strongest soap Lee
1 Lb Oil of Vitriol
1 Pint Whiting
mix with a painters brush to
it on the mould let it remain
3 or 4 Days wetting it every day
with the mixture —

2 would not a tube filled with
cotton fulfil the air & fill duct when
shaking into a coach?

(after Christmas in Lent

3. found the temperature of the sea at
700 fathoms to be 26° — query why
was not the sea frozen?

4. Sedative salt dissolved in Ether pro-
duces a beautiful green

Blow soap bubbles with a mix-
5. ture of Ether and Ethereal air a
hot iron — prodigious explo-
sion — The best way — fill a
bladder 3/4 with pure air, into
this pour about two tea spoon
fulls of Ether —

116. Liquor Silicum and Arsenic ac
produces a Solu- very hard —
an equal bulk

117. Nitrous Acid with ~~Salt~~ water
dissolves Gold to a deep olive
this with Saturated Sol of Sulphate
produces a Solu

118. into a Proof of Caustic Fixed Al
but a small Quit of Chlorhorus
after heat — Nitro — The air w
a strong Reaction of Gases forms a
bubble which explodes —

119. To make the Liquor Silicum, h
some green glass into a small
mix equal parts of fine Silica
Caustic ~~Potash~~ Soda & strong heat
in three or four days a Solution
is produced which dissolves in a

10. Manganese oxide) in the proof
wheel - lapis ollaris - produces
brown air when nitric - the new salt
(called the muriated alkali or oxige-
nated) does produce the brown air &
substances yet known —

11. Pure ether should always be decanted
thro' lime water —

12. The manganese like Chrystals
the heart — Exeter —

13. In the Experiment of the Chrystal-
lization of Glauber Salt it will
sometimes succeed by pouring the
water into the solution
but sometimes by evaporating it into
the spirit.

14. In preparing muriated tincture the
marine acid should not be diluted

15. The last seven articles belong to
Chemistry —

125. Is it possible that a boy Jedediah
Cushbottom will by its friendship
Edy knock a man down? — Mr. Dor

126. Instant'aneous from non tonnage a
steam Englis, Chuckster, not ni Du
agreable as result — but for Jane
and Balloon —

127. Charcoal is the best antiseptic
for clearing glasses that have a
bad smell — Water at sea — Lim
— 5 £ to every butt ——

128. Rheumatic motion with a v
like a Ventilator — hot iron

129. The saw dust of Sandal wood wa
generally prevent rust — L-

130. It negroi food was bleached wh
by Phlogisticated muriatic

131. Every vegetable substance is bleac

very while, by the dyeing instead main
and. Wool was tried and little or
no change was produced, tho' the wool
was well washed in an Alkaline
Liquor ~~but~~ for it from very
oily and greasy Particles

2. In the Exp.t 130, the pieces of cloth
afterwards dyed were scoured in the second a
little warmed — colour in the first Exp.t
returned

3. In the East Indies Cutloch boils
Jaggery with Indigo a Sufficient
or Pound into Spirits of wine

4. Manner of diluting other Ingredients
so as to Ascertain a Standard
small expence. ——

35. The Discovery English from foreign
Vermilion — Dr. Hope of Green Ink burns
the Sent Celadon, but does not affect the other

136. Engraving with the Nitric Acid

After finishing on the common or
plain ground as it is called, hold it
a Lamp and Rotation it, Run tra
with a pencil as in common dra
but pressed Sharp with out g
into a smooth or velvet and a
fitly a gentle heat, place the plat
in the Varnish and in a few h
it will be dry. As fast comes
the pencil as Sharp with out g
in the tracings. Thin a little
made thin the pictures —
Composition for the Etchin
ground

2 oz Burgin Wax
3 — Asphaltum
1 ½ — Rosin
1 ½ — Mastic

Iron Powder in a Mortar
then Mix'd with the wax over a
slow fire — This is put into a Bath
Bag and the Metals is rubbed with
the Bag —

37. Make a Paste of Sulphur Oleum
Spirit of Salt, Nitr dulcified with
water Mother an excellent blue
which will not corrode the Iron.
With Vitl. acid it will corrode the
Iron

38. In burning metals in Asphalgis-
Lucubrii — ordu — 1 Pin 2 Very fine
brushes 3 Copper wire 4 Emmistick
of Brass 5 Lead 6. Platina —

39. Wash Spunge good. Iron an-
neal in the fire

40. Bottle Impregnated Asphalgis-
calcubrii, for metals to clean metals

141. Dieter Thorstrom is going out of doors, but some what more than ordinarily dressed, as he has a gentle heat, shake & thoroughly (with wet) frost bitten feet, which when thawed (with cold water) will cause pain — Saturn rings on the bottle —

142. Put a bit of Sulphur Thorn in a flask of warm water mix well the Sediment of water, blow from a Blow Pipe & Distinguished ears, it will burn in flame in the water ——

143. How do the Chinese teach their Children? — Answer by reading Silk worms —

144 If a bottle be filled with mercury or Quicksilver & Paris, then the

wax cords and the Plaster rubs
the bottle bursts — Now the reason
why wax candles cannot be cast in
moulds —

43. Is Franklin he invented it
Lincoln tells a more Shady motive
— Gun will it more fully? —

44. It is said that the Chinese join
together two large Umbrellas with
a Rod between on this they rest
the boat, and descend from a height
of 50 to 60 feet —

45 What fact has allowing on the
Thermometer ½ will a current of
air of the same temperature take
42 Ball painted Black — flat —
advantages disadvantages —

146. What is the difference in effect between
Boiling heat & Cold and in freezing —

147. In what manner can the Hand
& Clouds be moved by the Fingers —

148 To measure the depths of the sea —
— Sea Lange
Soundings —

149. Hydraulic Dances — Fig. on
conical Funnel over a jet of water —

150. Marlboro vessel — small hole
in the bottom — hose thro full com
the end of the hose no water will
run through the bottom &c —

— A similar experiment with a gl
filled with water and a piece of shap
stuck over its mouth being drawn
downwards away, the water will run
in the inverted Glass —

1. A bit of metal and work just made
to milk in water, under the air pump
receiver it will rise. —— N—2

2 — Heat of the four elements — Glass
7 Inches long and 3/4 Inch diameter
— Suspended glass 2. oz: Tar: & dilig^r
3. Tincture of Salt of Tartar 4 h Distilled
with oil Earth, water air and Fire
N—2

8. Experiments of the Images on the air
Feathers heavier than lead
pumps —
— Butterfly suspended by the pool —

4. Boil in a small Earthen vessel a
small bit of Phosphorus size of a pea
in half
in a glass of clear water — Take a phial
with a narrow neck and glass stopper
and plunge it first into boiling water
then cool it, and put the boiling
mixture into it, instantly stop the vial
forcibly — there will brights & thunder
— Saturn ring &c —

155. Take a common rose Jacket and
hold it in the fumes of Sulphur over a
chafing dish it will become white
— Dip it in water — in 5 or 6 hours it
wash it is quite red — 11 — 2

156. Magic pictures — Two pieces of glass, 2
is best, about 3 by 2 Inches place
on each other about $\frac{1}{20}$ Inch asunder
This fixed by paper at the corners
join the glass by a cement of Mastic
Lime and the whites of eggs. Cover a
the borders with parchment or black
except a small opening on one side
to introduce the following Composition
— Powder by a Mortar 5 or 6 ounces
of gum Lac and put into half
an ounce of White wax and to each
it add nine ounces to the heat of
ounce or more of Linseed oil — S
when liquid must be poured betwe

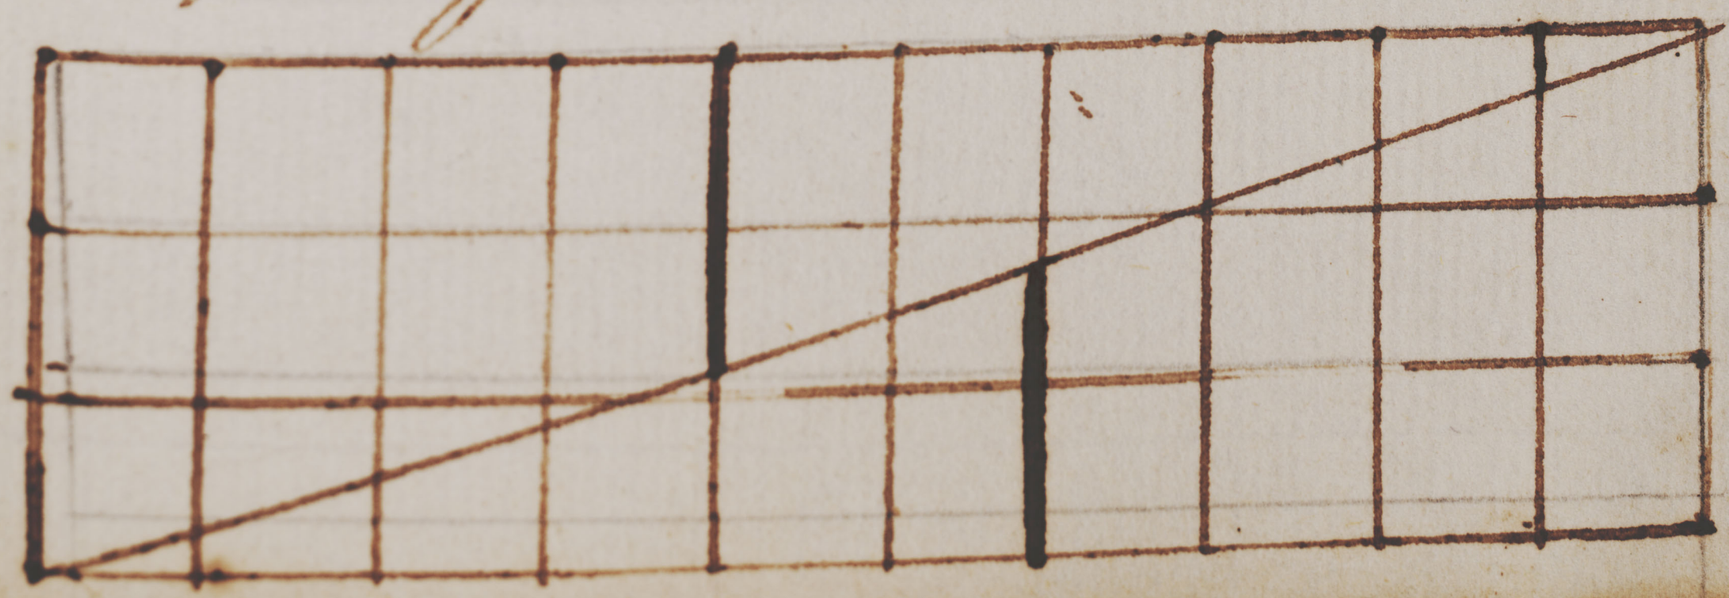
the glasses, and then stopped quite close
with the glasses clean and held them
before the fire to dry whether the instru-
ment is right — Paste a piece of paper
on any thin substance or a wound
ball with its face to one of the glasses
whole on a frame — Which will the
picture is invisible, even when not —
157. — Colour not affected by Nitrous oxyde
influence of the air — Copper plunged into
in Volatile spirit. just melted decanted
invidues a fine blue — Both the bottle
and the colour will presently disappear
— until fired return — & several times
150 Repeat the latter — All acids
for a red with them the vegetable infusion
is changed over the working — All Bases
a green — Dynst: with redundant acids
by heat very numerous — Strong solu-
tion of bett: in water — fumes of Ammonia
Onions &c —

Sympathetic Inks

— Iron. Take Galls in powder and
dissolve it aqua regia for twenty four
hours — Then the liquor clear off and de-
lute it as much as more common water
— could well worked — This may also be
made from the Regulus of Cobalt by
the process mentioned before —
— Vitriol changed to Green —
— Allum mixed with Lemon juice the
— Lemon remedy by being melted — or
Allum alone — All Saline Liquors
such as Orpt. Vit. and Nit. acids dilu-
ted (fixed) Vegetable alkalies &c.
produce the same effect —

159. Silver Dissolved — 1 oz Some Silver in
3 oz strong aqua fort. — When dissolved put
this aqua fortis into another glass bottle
with 7 or 8 oz. Rain or
distilled water. To this add the Sil-
ver — common common thread — few days
months

Experiments

№ 4


60. Geometric money — Let the first
of 10 inches by 3 be divided into
30 squares. Draw the diagonal and
at the fourth division from the bot
cut each triangle — Then with them
be two triangles and two trapeziums
Place them at first and make
a piece of money in each figure.
Then the first piece weighs as
he make 32 instead of thirty
The two trapeziums form a triangle
5 by 4. and the two triangles a
2 triangle of 6 by 2
