A Superlative Elevator Service

CHARACTERISTIC of the Company's magnificent modern building, the elevator service provided for the Canada Life Assurance Company's new head offices is one of superlative efficiency.

It comprises a battery of six elevators of the Otis-Fensom "Micro-Leveling" type, the fastest, smoothest and safest that specialized engineering has produced.

The Otis-Fensom Elevator Company takes a particular pride in the fact that it was requisitioned to supply and install these elevators.

Only an Otis-Fensom is a "Micro-Levelling" elevator.

Simpson's Chose INDIANA LIMESTONE for Strength and Beauty

Department Store: Robert Simpson Company Limited, Montreal
Architects: Messrs. Chapman & Oxley, Toronto
Builders: Messrs. Robertson & Janin, Montreal
Cut-Stone Contractors: Ritchie Cut Stone Company Limited, Toronto

The impressive dignity of Simpson's new store in Montreal is vastly enhanced by the use of Indiana Limestone. The owners of this magnificent structure built with vision . . . for a strength that will endure . . . a beauty that time will mellow with a richer loveliness.

Simpson's also chose Indiana Limestone for the new addition to their Toronto store. The beauty of this huge edifice is in no small measure due to the use of Indiana Limestone.

Its easy workability and speed of fabrication make Indiana Limestone the most economical medium for expressing the architect's design. *Over eighty per cent. of its final cost is spent in Canada,* in transportation over Canadian railways and in wages to Canadian workmen. It is in every sense a Canadian-made product.

Ask any experienced cut-stone contractor what he thinks of Indiana Limestone. He will tell you that not only in large commercial and public structures is it the ideal building material, but in fine homes as well.

Let us send you literature showing modern buildings of Indiana Limestone and information regarding remodeling. Just write us.

HEAVY-FOOTED BUBBLES

VISCOSITY TEST FOR VARNISHES

A rack contains a series of sealed tubes, filled with liquids of different viscosities to serve as standards for the ordinary range of varnishes. The viscosity of a varnish is determined by placing a sample in a tube . . . putting it beside one of the tubes containing a standard . . . inverting both the standard and the sample . . . and timing the bubbles of air, left in the tubes between the cork and the liquid, as they rise to the top of the tubes. The rates at which the air bubbles rise in the tubes are compared, and any variation from the standard is noted.

WHEN is a varnish too thick or too thin? When does it have the right consistency to flow together so as to eliminate brush marks . . . to give a film of just the sheen needed for the greatest beauty?

Letting it drip from the end of a painter's paddle is one way. C-I-L chemists use a more scientific method (shown here) to determine the viscosity of a varnish. This viscosity test is one of many, made to give you finishing products that you can specify with full confidence in their unvarying high quality . . . in their ability to protect and still further beautify your design.

All this scientific investigation of C-I-L varnishes and enamels is known as *Pre-Testing*. It is followed in establishing new formulas. It is the rule in maintaining established standards of production. It includes testing of raw materials . . . rigid control of manufacture . . . the severest checking of finished products. It is proof of the desire and determination of Canadian Industries Limited to produce finishing products that meet your needs.

A LUXURY

... at low cost

The **Wallglow** **SHOWER**

Can be installed in any bathroom . . . no matter what the height of the ceiling . . . in an hour or so. Costs a great deal less than a built-in shower.

A lifetime of reliable performance comes with this better fixture. Nothing to come loose . . . nothing to wobble . . . nothing requiring constant attention.

Heavy brass tubing . . . with that superior WALLACEBURG plating . . . chromium or nickel . . . whichever you prefer . . . heavy eight-ounce white duck curtains, with dome fasteners for completely enclosing the bather . . . and special faucet for sending water up into the shower head or down into the tub.

A truly worthwhile fixture . . . and, like all other WALLACEBURG products, it STANDS OUT because it STANDS UP.

Sold by plumbers everywhere in Canada.

ELECTRIC service is highly important to every grain elevator. It is the motive power for the operation of an intricate system of fans, belts and hoists . . . it provides adequate illumination . . . it makes possible both audible and visible signals.

Many dangers beset this electric service. It must be permanently protected against mechanical injuries . . . grain dust which seeps into every corner . . . and even rodents which might cause serious damage.

For these reasons, engineers and contractors almost invariably specify Beaverduct because they know from experience that this tested conduit affords complete and lasting protection to all electric wiring.

If you are interested in the advantages which Beaverduct offers you on any installation, just write to the nearest branch office of C. G. E.

IT HELPS GET NAMES ON LEASES

SUCCESSFUL builders find that Frigidaire exerts a powerful influence in getting tenants . . . and *keeping* them. For between two buildings of equal merit, the one with Frigidaire is invariably chosen first. And the reasons are obvious.

Frigidaire has the famous Cold Control and patented, self-sealing ice trays for faster freezing of ice cubes and desserts. It has the Hydrator which retains the garden-freshness of fresh vegetables. It has the Quickube Ice Tray which releases one or a trayful of ice cubes at the touch of a finger. Its powerful mechanism insures trouble-free, automatic service for years.

FRIGIDAIRE
A GENERAL MOTORS VALUE

But let us tell you more about Frigidaire. Our new book for architects and builders shows the latest Frigidaire models and outlines various methods of installation . . . for new buildings or old. Sign and mail the coupon to-day.

CONCRETE CONSTRUCTION *means WORK for* Canadians

You do more than assure a permanent, fire-safe job when you specify concrete. You measurably help the unemployment situation. In more ways than one. First, there is work on the job itself. Then there are jobs for those involved in the making or handling of the aggregate, reinforcing bars and form lumber, all of which are all-Canadian products. Specify concrete construction.

We maintain a Service Department to cooperate with you in all lines of work for which concrete is adapted. Our library is comprehensive and is at your disposal at all times without charge. Write us.

S E R V I C E

How Johnson Control Is Applied To This Impressive New Building

Added to the very many notable buildings equipped with Johnson Control is the new Los Angeles Stock Exchange. Four separate systems of air conditioning are in this building; supplying the Trade Room, Two Clearing House Sections and the general offices extending from the sixth to the eleventh floors. All are under The Johnson System Of Control.

The dry and wet bulb temperatures on each system are controlled by Johnson Wet Bulb Thermostats, located in the fresh air intakes and operating the fresh air and return air dampers in unison.

The temperature of the water in the dehumidifiers is controlled by a Johnson Three-Way Valve in the pump discharge, operating from a Johnson Dry Bulb Thermostat. In addition, a Johnson Three Branch Four-Way Pneumatic Switch is located in the engineer's office, by which these valves are operated manually when desired.

Included in this installation is the standard Johnson Thermostat Control on the radiation and the ventilation throughout the building; automatically maintaining each section and room at the temperature desired, regardless of the weather conditions out-doors; and producing a large saving in heating cost per year by preventing the usual overheating and heat waste and the excessive, unnecessary fuel consumption thus resulting.

ALUMINIUM SPANDRELS

on the
Aldred Building
Montreal

Barott & Blackader
Architects

The Foundation Co. of Canada Limited
General Contractors

The Robert Mitchell Company Limited
Ornamental Contractors

AN interesting example of how modern architecture can be in full harmony with historic surroundings is provided by the Aldred Building, which now towers above some of Montreal's oldest structures in Place d'Armes.

Massive buttresses, rising to the very top of the building, give it a monumental appearance. Set beneath the windows, gleaming high-lighted spandrels carry vertical lines of beauty skyward. And, as in most modern buildings, these spandrels are made of Aluminium.

Aluminium possesses excellent casting qualities permitting unusual sharpness of detail. (See unretouched photo above.) The lightness of Aluminium Spandrels, approximately one-third that of other metals, makes them easy to handle on the job with a consequent reduction in erection costs.

Let us send you full information.

YOU CAN BLEND

LIQUID GRANITE GLOSS

AND DULL FOR ANY

DESIRED SHEEN

ANY desired degree of luster from a velvety sheen to diamond-like brilliance is possible when you specify Berry Brothers' Liquid Granite Varnish for natural floors and woodwork. This is the million step-test floor varnish—made by secret formula of the finest ingredients obtainable. Rubbing is not necessary to achieve beautiful effects because Liquid Granite Gloss and Dull can be blended for the sheen you prefer.

Liquid Granite is a tough, elastic varnish—unequalled for long-life and good looks. It can be washed again and again—never turns white. Rigorous tests conducted by the Detroit Testing Laboratory plus performance records established throughout more than 72 years of manufacturing prove Liquid Granite's amazing resistance to wear.

In addition to Gloss and Dull—Liquid Granite is made Quick-Drying to meet the modern demand for speed. Let our architectural department give you all the facts about this finish and others in the Berry Brothers' line.

LEADERS OF INDUSTRY CHOOSE STEDMAN REINFORCED RUBBER FLOORING

PART OF SECOND FLOOR, IMPERIAL TOBACCO CO. OFFICE BUILDING, MONTREAL, QUE., SHOWING STEDMAN REINFORCED RUBBER FLOORING

LEADERS of industry like the Imperial Tobacco Company do not select flooring for mere beauty. Such careful buyers consider serviceability above all. The installation of Stedman Reinforced Rubber Flooring in the office building of the Imperial Tobacco Company is typical of the trend of the times. This flooring meets every demand of the ideal covering because it has extraordinary endurance, is non-stainable, is easily cleaned, it does not stretch or buckle, and it is quiet and resilient. It is made in a wide range of plain and striated colours.

JUNE

Confederation Building,
Ottawa
*Erected by the Department
of Public Works.*

The Confederation Building at Ottawa

is the most modern structure recently erected in the Capital City of Canada and it is interesting to note that 2" of Armstrong's Corkboard was applied over the entire roofing area.

ONE of the advantages of insulating a roof with Armstrong's Corkboard is the protection it affords the top floor from summer heat.

This feature is of particular importance in office buildings and apartment houses where the space under the roof is used for offices or living rooms. Ordinary roofings have little resistance to the transmission of heat, and air spaces between the roof and the ceiling are of little value. As a result, top floors are usually unbearably hot in summer, a totally unnecessary condition which can be easily corrected by insulating the roof with a single layer of Armstrong's Corkboard.

The insulation of roofs with Armstrong's Corkboard is not only a distinct advantage, but a profitable investment financially. It makes top floors comfortable winter and summer and, therefore, desirable the year round.

An important consideration in the insulation of such roofs is the specification of an adequate thickness which should be from 1 to 2 inches. Corkboard insulation has this advantage, that it is made in 1, 1½, and 2-inch thicknesses and can, therefore, be applied in a single operation and at low labor cost as compared with thin materials built up to these thicknesses.

Armstrong's Corkboard combines, better than any other materials known, the structural properties essential to practical application, economy and permanence.

Specify and use Armstrong's Corkboard for Hotels, Office Buildings, Schools, Churches, Theatres, Factories, etc. Write for complete data to:

Experience . . . the best background for modern construction . .

Through 26 years of practical and scientific study of roofing and waterproofing problems, Barrett leadership has constantly demonstrated the value of applied experience.

In 1905 Barrett drew up the famous Barrett Specification. It was standard for flat-roof construction then. It is still standard today. Barrett was first to bond roofs against repair and maintenance expense—16 years ago. Barrett was the first to offer complete roof inspection service; and the first to bond flashings. The Barrett organization of Approved Roofers was the first ever established.

To discriminating building-owners, architects and contractors Barrett's long record of leadership has definite significance. It is assurance to them that when they buy Barrett Specification they are buying the finest pitch and felt that can be made, expert application by experienced Barrett Approved Roofers and Barrett's unequalled roof inspection service.

BARRETT COMPLETE ROOF SERVICE

The Barrett Company, Ltd. offers a complete roof service which includes the famous Barrett Specification Roof (Bonded for 20 or 15 years); Barrett Red Star Roofs; Barrett S. I. S. Roofings; Barrett Bonded Flashing Blocks and Forms; and Holt Roof Leader and Vent Connections. For advice on any roofing or waterproofing problem, consult with us or the Barrett Approved Roofer nearest you.

Barrett Specification Roofs

*To quote the architect who
designed this layout . . .*

“In designing this layout I started off with the idea that the conservatory was just as important in the design of the house as any other part. I tried to make it an integral part of the composition.

“There is plenty of evidence that conservatories are becoming more popular with home owners. This is presenting to the architect a new problem. Instead of steering clear of it he should accept it as part of his job and achieve the most artistic result possible.”

It is never our desire to thrust ourselves upon any architect; but with 75 years of specialized knowledge we can offer our co-operation in conservatory building to you with every confidence of its proving thoroughly useful.

The Royal Bank of Canada

banks on 17
Sturtevant Fans

*...to secure a
steady income
of good air!*

In banking institutions, where new trends in business are keenly studied and closely evaluated, it is quite natural to find one of the most effective modern methods of business promotion . . . dependable mechanical ventilation.

Consider, as an instance, the stately headquarters of The Royal Bank of Canada. On every floor, the air is always pure and refreshing. 210,000 cubic feet of new air is circulated through the building every minute by 8 Sturtevant Ventilating Fans. And every minute 235,000 cubic feet of vitiated air is exhausted by another battery of 9 Sturtevant Fans. In such a clean and bracing atmosphere, it is a pleasure to do business.

For projects of every type and size . . . whether buildings, tunnels, or railroad cars . . . Sturtevant can supply any equipment required for ventilating or air conditioning.

MURAL DECORATION

WHILE it cannot be said that mural painting in this country has received the recognition it deserves, it is, however, gratifying to note that during recent years there has been an increasing appreciation of its value and adaptability as a form of decoration. A number of outstanding murals have been executed recently for several important buildings, including eleven large panels and other decorations for the Jarvis Collegiate Institute, Toronto, by G. A. Reid, R.C.A., and Lorna Claire, A.O.C.A.; two large panels for the Manoir Richelieu by C. W. Jefferys, R.C.A., and F. S. Challener, R.C.A.; a series of decorations for the Log Chateau, Lucerne-in-Quebec, by Sherriff Scott; and a number of murals for the Empire Trade Building at the Canadian National Exhibition by F. S. Haines, A.R.C.A., and H. S. Palmer, A.R.C.A. At the present time there are also a number of murals under way, including four panels for the Chateau Laurier by Mr. Jefferys, and a series of decorations of the Humberside Collegiate by Arthur Lismer, A.R.C.A., while Arthur Crisp is at present engaged in the execution of eighteen mural paintings for the new Canadian Bank of Commerce Building, Toronto.

This increasing demand for mural decoration is most encouraging, and indicates, we believe, a greater use of this form of decoration in the future.

THE JOURNAL is glad of the opportunity to present to its readers an example of some of the work recently done, and in this connection we include in this issue an article on the series of murals completed last year for the Jarvis Collegiate Institute.

DECORATIVE ART

The decorative arts, particularly that of painting, have passed through many phases in an endeavour to be creative and escape from being overly trammelled by tradition. The modern tendency to abandon traditional forms in architectural design involves the creation of forms and treatment of material which cannot depend solely upon an architect's individual inventive power.

At one time the architectural profession was accused of being dormant and lacking in inspiration. Recently, however, architecture has been animated by the demands of modern life and conditions, until it now enjoys undoubted leadership in creative art. This should bring about a closer sympathy between the artists resulting in a collaboration which must eventually lead to the creation of a new era in the history of the arts, whereby they will be as closely allied as they were during the Renaissance.

It should therefore be incumbent upon the profession to encourage and sponsor intelligent collaboration between architects, sculptors, painters and craftsmen. One encouraging sign in this connection is the increasing realization on the part of the professional bodies to the value of such collaboration. The American Institute of Architects has, for a number of years past, given public recognition to the efforts of the allied arts by awarding a fine

arts medal for distinguished achievement in sculpture, mural painting and landscape architecture. In an address delivered some years ago at a meeting of the American Institute of Architects, Mr. Vitale, well-known landscape architect, speaking on the collaboration of the arts, said:

"Architects, landscape architects, painters and sculptors can all learn from one another, especially in the formative years of artistic education. The architects can impart to others that supreme sense of order which dominates and unifies the well-conceived plan of a building or of a group of buildings; he can explain how the masses, the forms and the ornament of his compositions vary with the different inert materials which he uses. He can show the inevitable relation between his artistic conception and the stern reality of the mechanics of building. His trained sense of scale and fitness is a precious gift. Is there nothing in his equipment that can benefit the other artists?"

The landscape architect has specialized knowledge of ground forms and skill to utilize them in a sort of planning which, especially on large areas, is quite different from the planning of the architect. Where varied topography prevails he obtains order out of co-ordination and correlation of masses rather than symmetry of plan.

He plays with live materials, alluring and treacherous; from them he draws colour and texture for pictorial effects; from their trunks and limbs and foliage the character of his masses and the harmony of the sky-line. He plays with water and with it gives freshness and repose or appeals to the sense of sound. He plays with flowers, with their colour and their scent. Exceedingly varied, if not infinite, are the human emotions upon which he can play. Is there nothing in his treasure chest that could not be shared by other artists?

"The sculptor plays with clay and stone and bronze. From it he can give you the realities of life or the idealism of a race, the stern character of a Puritan or the frivolity and grace of a dancer, the harmony of the forms of Phidias, the joy of human happiness. His work can be formal, architectural and stately or picturesque, romantic and playful. Will the association of kindred spirits with this artist not increase that sensitiveness for beauty which is the most marvelous gift of the gods?"

"And the painter. Does he not interpret the same human emotions and present them to us by other means with equal intensity? Does he not rejoice in happiness or mourn in sorrow? Does he not make us understand human character, social life, inert or alive nature? Don't we need the understanding of his brush and the association with his spirit?"

Now more than ever it is necessary to foster the spirit of collaboration between the arts for if painting and sculpture are to form a vital part of our architecture in the future, it is just as necessary for the architect to have a clear conception of these arts as it is for the painter and sculptor to acquire some appreciation of architectural form.

A Sidelight on Partial Service Work

The following article is one of a series covering various points of architectural practice and is sponsored by the "Public Relations" Committee of the R.A.I.C. who will be delighted to have your comments. Please address them to Public Relations Committee, care of THE JOURNAL, 160 Richmond St. West, Toronto.

THE table in the corner where some of the local architectural talent were wont to congregate for their frugal luncheons was peopled by two or three, when Stanley, the Bright Young Architect of our acquaintance, dropped in and ordered his bowl of soup.

The discussion seemed fairly animated and it soon appeared that one of the architects was a bit annoyed with a certain client of his. It seemed he had designed an attractive house for this man, who had been delighted with the sketches and had not balked at the fees except to ask what proportion of them applied to the different parts of the work. He had finally, however, informed the architect that he wouldn't require his supervision, backing this up with such good reasons as to why this was advisable, that he had gotten away with it. The work was being done in an adjoining municipality and the architect had this morning just returned from his first visit to the work now four-fifths complete.

He was fed up. The bricks were too red; the shingles were too green. The details of the entrance were all different and the wrought iron railing was a joke; the trim was all stock; the living room mantel and the stairs were terrible, and that confounded contractor had had the colossal nerve to put a big sign on the job with the architect's name on it in bold letters. The job was a disgrace the way it was being built. They could dashed well take his name off it even if he did make the drawings.

The B.Y.A. chimed in: "That sort of thing is one of the reasons why the Old Man won't let me do these part service jobs any more. He's dead set against it though, of course, there are times one must."

A stranger at the table chimed in with a question. "As a matter of curiosity what proportion of the architect's fee covers the working drawings to the stage that a client thinks he can get along without you?" He was promptly answered "50%." Someone added, "But there are times when one can furnish the details and get paid four-fifths of the commission and get rid of the administration work and all the annoying quarrels with the contractors."

The B.Y.A. chimed in, "I have done that once or twice and saved heaps of trouble, avoided a lot of unpleasant work, which I didn't like, made a fine profit, and been paid promptly, almost before the job was finished."

"You fellows remember that apartment job in the East Ward. It was done that way. True there were some liberties taken with our details by the contractors and the owner. They cut a lot of things down without consulting me, but our office made a very good clean cut profit on that job."

The B.Y.A. laughed: "The OLD 'UN hates to admit we did that job. I've never quite understood

why, but he swears he won't lend his name on another publicly financed one unless he is going to have authority to see his plans and details through."

The stranger at the table had begun to look interested and somewhat restless when the apartment job was mentioned and after a whispered question to his companion, he turned to the B.Y.A. "I think I can see why your partner takes the attitude you mention. I happen to be both a tenant in that building and one of the bondholders, in both cases largely through the attractive description in the prospectus at the time the financing was being done and to no small extent on the strength of your firm being, as I supposed, in charge of construction.

"Perhaps you will remember that the prospectus drew a rather rosy picture of the 'class' of the proposed building.

"Well, your remarks just now about a lot of details and things being cut down without consulting you make it clear to me now where the 'class' disappeared to, and it makes it easier to understand why those bonds of mine don't look so well secured to me now as they did when I got 'em. I reckon there was enough taken out to make sure the bond issue paid for the building and perhaps then some."

The B.Y.A. was a bit taken aback. He managed to say something about—"Yes that — contractor promoter did spoil the job."

The 'Unknown' hesitated a moment. "Well," he said, "I'm glad to hear you have decided that you now want control of jobs where your firm is publicly on record, either directly or indirectly, as to its cost and atmosphere. The bondholders and tenants should be more likely to get what they were led to expect."

The B.Y.A. didn't like this at all. "We didn't undertake to act for the bondholders and it was never said that we should be supervising the job, and in any case we were being paid by the promoter and had to take our orders, you know."

"Quite so, quite so," remarked the aggressive stranger, smiling, "but you'll admit it is a 'touchy' situation to be in. For the life of me I could never understand why high class firms like yourselves allow themselves to be put in such a position. It certainly doesn't enhance reputations, and it seems to me very foolish to allow yourselves to become merely well paid designers, sort of super-draftsmen, for a promoter and the contractor."

"It has always seemed to me that control of the execution of the work and the resultant control of large amounts of purchasing was the source of a great deal of the respect usually given to the architects and if that is at all correct one would expect the profession not to surrender such privileges lightly.

Some architects consider themselves lucky to be relieved of detail work, particularly that incidental to exercising administration duties and the resultant close touch with sources of building supplies.

By accepting contracts to supply drawings and specifications, even including working details but omitting those "uninteresting" administration details, it is conceivable that over "the long pull" the architectural profession might eventually lose a great deal of the prestige enjoyed by those who directly control the placing of a great deal of purchasing.

NEW HEAD OFFICE BUILDING FOR THE CANADA LIFE ASSURANCE COMPANY, TORONTO

From composite photograph of model and surroundings

Sproatt & Rolph, Architects

The New Canada Life Building, Toronto

SPROATT & ROLPH, Architects

THE planning and design of most buildings is governed to a large extent by such factors as the requirements of the owners, the nature of the property, and the character of the surroundings. In the case of the new head office building of the Canada Life Assurance Company, the principal requirement of the owners was the provision of a large area of unobstructed floor space capable of subdivision into departments of widely varying sizes. The site chosen by them, while of restricted width, was ample in area and situated at a point which will become increasingly prominent as the new University Avenue extension project develops.

Consideration of these conditions led, in the initial stages, to the development of a comparatively low building, some six storeys high, having a length from north to south of approximately six

hundred feet. This was ultimately abandoned, because of the comparative ease of vertical travel as opposed to horizontal, in favour of a higher building of a more moderate length. The plan eventually adopted, as the accompanying plates show, was in the form of the letter "E," with the long side running north and south along the east side of the property. Each block of the building is about sixty feet in width, and the floors are carried across this span by steel girders at twelve foot centres. Elevators and stairs are arranged in the "dead" central area, leaving the whole of the lightable space, with the exception of the lavatories and cloak rooms, free for office use.

On the main floor, the north wing is occupied by the legal department of the company, and the south wing by the Toronto city branch, each with

EIGHTH FLOOR PLAN

THIRD FLOOR PLAN

GROUND FLOOR PLAN

GROUND, THIRD AND EIGHTH FLOOR PLANS, CANADA LIFE BUILDING, TORONTO
Sproatt & Rolph, Architects

its own entrance direct from University Avenue. In the centre is the main entrance, consisting of a triple arrangement of entrances and vestibules, from which the corridors and elevator hall lead through to the central entrance on Simcoe Street. Bronze has been used for all the entrance doors, as well as for the outer and inner vestibule screens and doors to the central entrances, both on University Avenue and Simcoe Street. In addition, the main entrance has been enriched by three pairs of polished aluminium gates.

On all typical floors, from the second to the seventh, lavatories and cloak rooms take up all space in the central block west of the elevator halls, both sexes being provided for on each floor. The remainder of the space is entirely open, and divided by walnut partitions and rails into departments of various sizes. The floor in all these spaces is linoleum; walls, painted plaster; and ceilings covered with sound-absorbing material.

On the eighth floor are the hospital, laboratory, library, rest rooms for both sexes, and the assembly

VIEW OF CANADA LIFE BUILDING FROM OSGOODE HALL

Throughout the central halls and corridors, the walls are faced with St. Genevieve marble in ashlar courses with which the columns of emerald pearl granite strike a sharp contrast. Door trim and base are carried out in Renfrew marble; while the floors are paved with travertine in two shades, divided by brass floor strips and enriched with marble mosaic borders and inserts. A very interesting feature in the floor of the entrance hall is the bronze insert designed by A. Scott Carter, R.C.A., and modelled by E. Wilson. The enriched plaster ceilings in this section have been covered with gold leaf and glazed, and the architectural scheme is completed with aluminium lanterns finished in a similar manner. The treatment of the remainder of this floor and of all typical floors up to the seventh is very simple, consisting of painted plaster walls, acoustic ceilings, linoleum floors, walnut trim and partitions.

hall. This latter occupies the entire north wing, and is approximately 55' 0" wide by 98' 0" long. The ceiling is vaulted and coffered, the floor laid in oak block, and the walls treated with a wood dado to sill height and panelled with mouldings above. The hall is lighted by means of twelve cast aluminium electroliers suspended from the two longitudinal ribs which traverse the ceiling from east to west. The library is a generous room, treated in a somewhat similar manner, with recessed bookcases at the north and south ends and a ceiling divided into five enriched panels by beams crossing from east to west.

On the ninth floor is the staff cafeteria, which occupies the entire east block of this floor, giving a room about fifty feet by one hundred and seventy-five. At the present time, the counter in the southwest corner gives adequate service, but provision has been made for the installation of a second

counter in the northwest corner to take care of increased requirements. The kitchen and services connected with it are arranged in the central block, west of the elevators, and service to the counters is obtained through the stair halls on either side.

The chief executive offices are arranged on the eleventh floor, with the president and general manager occupying suites in the southeast and southwest angles respectively. Each of these

elevators, and are served from a kitchen in the east portion of this block.

In the tower are the telephone switchboard room (13th floor), elevator machinery (14th floor), board room (15th floor), storage floor (16th), observation lounge (17th), tanks and machinery for tower elevator (18th). The board room and ante room are finished with painted wood panelling on the walls, enriched plaster ceilings, oak block floors and

ENTRANCE VESTIBULE

officials has a reception room, secretary's room, office and private toilet. A large reception room occupies the three central bays, and the remainder of the floor contains the offices of the assistant general managers, their assistants and secretaries. The treatment of walls and ceilings throughout is simple, and in most cases the woodwork is finished in paint. Walnut dado and trim have been used in one or two rooms where desired by the officer concerned. Junior officers are accommodated on the floor below, as well as the chairman of the board and the vice-president, who have a suite of rooms west of the elevator hall. The dining-room for senior officers and a smaller private dining-room are located on the twelfth floor west of the

bronze electric fittings. Plastered and panelled walls and coffered vault, all in plaster, together with aluminium electroliers and brackets, comprise the treatment of the observation lounge.

All corridors and halls from the eighth floor to the twelfth, as well as the entire floors of the cafeteria, dining rooms, observation lounge and hospital section, are covered with mastic tile in large sizes, laid in chequer pattern, dark red and black alternately.

The vault and examination room are placed in the first basement, together with current filing, work shops and food storage and preparation rooms, and the second basement is devoted to dead storage. The first basement is connected by tunnel

with the boiler house and garage on the west side of Simcoe Street. All materials and furniture are received at this latter building, taken by freight elevator to the tunnel, and so distributed to their destinations in the main building. The tunnel also carries the heating mains from the power house to the main building.

The building is heated by direct radiation on a controlled vacuum system, the steam being supplied by two 500 h.p. water tube boilers, coal burning. A small tubular unit supplies steam for domestic hot water and kitchen services during the summer. All these boilers are equipped with underfeed stokers and vacuum system for removal of ashes.

Ventilation of the basement and working floors is by means of unit-ventilators, and a central system for the vault and sub-basement.

Water for domestic, sanitary and fire purposes is arranged with several sources of supply, and fire protection is supplied by a fire pump, together with stand pipes, fire hose and electric signal system. A tank of 40,000 gallons capacity is installed on the 18th floor to supply domestic and sanitary water above the eighth floor. The building equipment also includes ice water, refrigeration system, garbage incinerator (waste heat from which is used in heating water), pneumatic tubes and a vacuum cleaning system. The elevators are gearless traction, micro-levelling type, operated under full signal control, with electrically operated car and hatch doors, and a maximum speed of seven hundred feet per minute. The car operator sets the desired stops by means of push buttons in the car,

and the mechanism then automatically controls the starting and stopping of the car and the opening and closing of the doors, as well as passengers' calls from the various floors. One of these cars runs to the 17th floor in the tower.

In designing the exterior of the building, as in the detailing of the interior, the architects have striven to express in some measure the importance and stability of the company, while retaining the essential simplicity of an office building, and at the same time have endeavoured to produce a structure which, in process of time, shall harmonize with its venerable and dignified neighbour, Osgoode Hall. The fact that the main floor is essentially a "working" floor eliminated the possibility of any great height for the entrances, the necessary central emphasis being secured by the use of a colonnaded portico. Carving and decoration were reduced to the minimum and reliance placed upon the building up of the mass toward the tower for effect. Indiana limestone with a base of Milford pink granite is used for all exterior facing of the main building, and the same stone with a base of Queenston for the garage building. The east face of the main building is enriched with a heavy cast aluminium fence which protects the areas and terminates on a stone pier at either end. A lighter wrought iron fence protects the remainder of the property.

The architects for the building were Sproatt & Rolph, and the general contractors, Anglin-Norcross Limited.

—*Gladstone Evans*

OBSERVATION LOUNGE IN TOWER

Department of Art, Science and Research

Conducted By B. EVAN PARRY, M.R.A.I.C.

Paralleling a remark made by the Committee of the Department of Art, Science and Research, in the May issue of *THE JOURNAL*, to wit "that there is a valuable sphere open for the exploration of this field of economy by members of the profession," by using the Canadian Engineering Standards Association bulletins, it is now recommended that the annual reports of the National Research Council of Canada should be in possession of every practising member of the profession, since there is no doubt in the mind of your committee that the before-mentioned council will indulge in research work of such nature that will be of value to the architectural profession, if sufficient evidence is brought before their notice as to the need of such activity.

This annual report can be obtained from the secretary, National Research Council, Ottawa, Canada.

The Forest Products Laboratories of Canada have recently issued a brochure under the caption of "Canadian Red Pine as Interior Trim," by W. J. LeClair, chief, lumber seasoning division.

Attention is called to the paradox that while Canadian red pine has long enjoyed favour in the

British market as a material for interior finish in churches and houses, that is one of the purposes for which it has been least used in Canada. The reason, it is claimed, was two-fold. First, since the higher grades were exported in the form of planks and deals for re-manufacture in Britain, the Canadian trade became accustomed to handling only the lower end of the stock. Secondly, an opinion was current that its resinous nature would interfere with its successful kiln-drying and would mar subsequently applied finishes. Kiln-drying being essential to the successful use of lumber in our heated Canadian interiors, this objection had to be proved erroneous, before it could be hoped to convince architects and builders.

With a view of obtaining definite data on the subject, the Forest Products Laboratories of Canada recently tested its reaction to kiln-drying and its suitability as interior trim under Canadian conditions of heated interiors. The tests were of both a laboratory and a commercial nature. An excellent summary of results is given in this brochure and, without a doubt, it would be quite worth while for members of the profession to obtain copies for their files from the Forest Products Laboratories of Canada, Ottawa, Canada.

Competition for the New Premises for the Royal Institute of British Architects

The Royal Institute of British Architects invites architects who are members of the R.I.B.A. or allied societies (which includes members of the Royal Architectural Institute of Canada) to submit designs in competition for their new premises to be erected in London, England.

The final date for the reception of drawings will be March 31st, 1932. Any questions which competitors may desire to ask must be received by the secretary, R.I.B.A., 9 Conduit Street, London, W.1, England, not later than August 4th, 1931. Replies to questions of the competitors will be available during the latter part of September, 1931.

The assessors for the competition will be Mr. Robert Atkinson, F.R.I.B.A., Mr. Charles Holden, F.R.I.B.A., Mr. H. V. Lanchester, F.R.I.B.A., Sir Giles Gilbert Scott, R.A., F.R.I.B.A., and Dr. Percy S. Worthington, F.S.A., F.R.I.B.A.

An award of £500 will be made to the author of the design placed first by the assessors. Premiums to a further amount of £750 will be awarded to other designs according to merit.

Conditions for this competition, showing plan of site, surrounding buildings and schedule of accommodation required, can be obtained from the secretary, R.A.I.C., 160 Richmond St. W., Toronto.

Awards to Students at the School of Architecture, University of Toronto

The Ontario Association of Architects' scholarship for 1931 (value \$100.00), has been awarded to Mr. F. Lasserre, a second year student for the highest honour standing in architectural design at the annual examinations. Mr. J. H. Craig, president of the Ontario Association of Architects and Mr. Murray Brown acted as judges, with the assistance of the staff in architecture.

The Architectural Guild Bronze Medal was awarded to Mr. G. L. M. Fowler, a fourth year student for excellence of design submitted. Mr. Fowler was also successful in winning the Darling and Pearson prize in a competition for a design for "A University Club."

Mr. R. M. Wilkinson and Mr. W. G. Quantz, third year students were awarded first and second prizes respectively, given by the Toronto Brick Company in a competition for a design for "An Archives Building."

The prize given by Mathers and Haldenby for the best set of drawings of old work made by a student during the summer holidays was won by Mr. G. R. Whale, a third year student, for a very creditable set of measured drawings of the "Bâby House" at Sandwich, Ontario.

The Royal Canadian Academy of Arts

The semi-annual meeting of the council of the Royal Canadian Academy of Arts was held in Montreal on Thursday, April 30th, 1931. Following a report given by the president of the activities of the academy, the matter of the next annual exhibition was discussed, and it was decided that the fifty-second annual exhibition of the Royal Cana-

dian Academy would be held at the galleries of the Art Association of Montreal. It was also decided to invite the Royal Architectural Institute of Canada to participate in future exhibitions of the Academy. The exhibition will be opened November 19th. Entry forms may be obtained from the secretary, Mr. E. Dyonnet, 1207 Bleury St., Montreal.

ERICSON DISCOVERING NORTH AMERICA, 1000 A.D.

Mural Decoration In the Jarvis Collegiate Institute, Toronto

THE mural decorations in the auditorium of the Jarvis Collegiate Institute form part of a memorial to the students of the collegiate who served in the Great War. Originally, the memorial took the form of a bronze tablet which was erected in 1917. Later on, a service roll tablet was also erected in the rotunda of the school. These, together with the murals, executed during 1929 and

1930, constitute the completion of the war memorial.

The general subject chosen for the decoration of the auditorium is Canadian history. A complete scheme was adopted at the outset by means of a model of the interior of the hall showing the whole design. This general design was made to conform with the classic style of the architecture of the auditorium, the various panels of which were

scroll signifying free government, while in the right she holds a wreath, a token of merit recognized. About the figure are grouped representatives of the family, law, education, labour, government and

defence, each expressing, in various forms of homage, devotion to the native land. School cadets bear aloft the flags of Great Britain and Canada, which float in the breeze. In the background are

Panel No. 10
PATRIOTISM

Boy Scouts carrying the banners of the provinces, and, in the distance, beyond a monumental wall and stately columns, are groups of trees and the blue water of Lake Ontario. Above is a blue sky broken by cumulus clouds. The wall and columns in this panel and in panel No. 11, together with the distance formed by trees, water and sky, are similar and serve as balancing features of the composition of the two panels which are placed to the left and right of the auditorium stage.

Panel No. 11. *Sacrifice*.—In front centre stands a Cenotaph, a mute memorial to those who gave their lives in the service of their country. Cadets stand at each side, holding aloft the flags of Great Britain and Canada, which droop quiescent. Young Cadets, Boy Scouts, Girl Guides, and a rank of helmeted soldiers of the Great War, are interspersed with family groups, students, educators, artisans, and other nation-builders. This assemblage of representative persons and groups gives expression of homage to the memory of the Glorious Dead, whose names live for evermore. A wreath is being placed on the Cenotaph, and young and old bear flowers and wreaths in token of remembrance and in recognition of the supreme sacrifice. Behind the circle, two ranks of cavalry flank right and left before a monumental wall surmounted by columns.

Besides the well-defined wall panels that made the hall especially suitable for decorative treatment, other smaller spaces were taken advantage of on each side of the doors and under the gallery.

Four of the dado panels, occupying a principal position under the panels, Patriotism and Sacrifice, are given a special treatment by containing two

figures, each bearing shields, emblazoned with the arms of Great Britain, Canada and Toronto. In three other panels of the same series on the east and west walls heraldic designs of interlaced scrolls and shields are emblazoned with the crests of the nine provinces and names of explorers and pioneers. Along the front of the gallery are shields bearing the arms of the great exploring countries, Norway, Italy, Portugal, England, Spain, France, and Holland, and a banded design containing the names of foreign discoverers and explorers.

Linked up with the banded and other parts of the decorations are a number of minor shields bearing varied emblems. In the long panels of the gallery front are emblems of navigation and discovery. In the panels of the dado occur the Rose, the Thistle, the Shamrock, the Fleur de lis, the Maple Leaf, and emblems from the Arms of the Provinces. The diaper of maple leaves forming the borders of the various historical decorative panels is also used as the background of all the heraldic panels, thus carrying out the significance of every part as an expression of the historical development of Canada.

The complete scheme of decoration was sponsored by a War Memorial Committee of which Mr. John Jeffries, principal of the Jarvis Collegiate Institute, was chairman and the funds required were raised by subscription from the staff, students and ex-students of the collegiate.

The design and execution of the murals were carried out by G. A. Reid, R.C.A., O.S.A., assisted by Lorna Claire, A.O.C.A., and in collaboration with the architectural department of the Board of Education.

Panel No. 11
SACRIFICE

Excerpts from a Report of the Fourth Pan-American Congress of Architects

A TRANSLATION of the report of the Fourth Pan-American Congress of Architects, which was held in Rio de Janeiro last year, has been sent to the R.A.I.C. by Mr. R. R. Prentice, F.R.I.B.A., a practising architect in that city who in the absence of a Canadian representative kindly consented to represent the Institute at the Congress. Some of the deliberations and conclusions of the Congress which were included in the report are extremely interesting and are printed herewith for the information of members of the Institute.

Regionalism and Internationalism in Contemporary Architecture to Attempt Idealism in the Architecture of America

CONCLUSIONS:

1. To point out to the public authorities the necessity for establishing a chair for the study of decorative art in architectural courses, with the special object of selecting and utilising in design elements in the national flora and fauna, with a view of achieving individuality of architectonic expression.

2. To point out to the public authorities the necessity for developing the study and practice of architecture of a national character, in such a way that they may comply with modern social requirements.

3. That the decoration of the public schools be inspired by local decorative tradition with the object of awakening in the scholars a feeling of patriotism.

4. That a request should be formulated to inaugurate in architectural courses a special chair for the study of national art, with the object of co-ordinating the tendencies and evolution of each country's art.

5. That on the other hand there is no incompatibility between regionalism and traditionalism with the modern spirit, it being possible to obtain national plastic expression within the rules and practices of ordinary procedure imposed on us by programmes and analogous materials.

The Teaching of Architecture

CONCLUSIONS:

1. The teaching of architecture should keep primarily in view the intensive study of architectonic composition, to which must be added artistic, historical, technical and scientific knowledge from an economic and social point of view, as being necessary to a complete practice of the profession.

2. That, since our cities, on account of modern conditions and requirements, will have to undergo changes, and new districts will have to be developed, all due attention should be given to the teaching of Urbanism.

3. That in the curricula of the architectural schools of each country there should be included the teaching of its own national art.

4. That in the teaching of architectural composition and of decorative composition, the "studio" spirit must be encouraged as much as possible, as it leads to greater collaboration between the students.

5. That the architectural schools should be under the direction of architects, should have a university

standing, and conform to similar or equivalent regulations.

The Sky-Scraper and Its Advantages Under Different Aspects: Hygienic, Economic, Social and Aesthetic

CONCLUSIONS:

1. Considering the difficulty of defining what is included under the classification of "sky-scraper," the congress recommends the competent authorities in each district to fix, in their regulations, a height above which any given building is to be included under the said classification.

2. Considering that the hygienic, social and aesthetic conditions of a sky-scraper depend not only on the peculiar conditions of the building but also on its site, the Council recommends and advises that the construction of sky-scrapers should only be authorized in districts indicated in the regulations.

3. Considering that sky-scrapers stand out prominently above the rest of the buildings in a city, either ornamenting it like real monuments or irremediably destroying its perspectives when badly planned, the congress recommends the insertion in the regulations of clauses which will allow these buildings to be submitted to a particularly severe fiscalisation from an aesthetic, social and hygienic standpoint, taking into account the dominant factors of each locality.

4. Considering that the failure of sky-scrapers as decorative elements in a city is frequently caused by the plainness of their lateral outer walls, the congress recommends that the laws of each country be modified to allow of the architectonic treatment of all such outer walls, so that the true plastic expression of this type of building may be assured.

5. Considering that it is impossible from an economic point of view to advocate or condemn in any general way the construction of sky-scrapers, owing to the complexity of the factors involved which vary from country to country and from time to time, the congress suggests, without definitely stating it as a fact, that this type of building has often given un-economic results in localities where a great number have been constructed.

6. Granted this, the congress concludes that sky-scrapers can fulfil hygienic, social and aesthetic requirements, provided the above considerations are observed. The economic aspect should be studied as a problem peculiar to each locality.

Urbanism and Rural Architecture

CONCLUSIONS:

1. The IVth Pan-American Congress of Architects expresses the hope that the remodelling and enlargement of American cities and the formation of new urban centres will be effected along general established plans in accordance with the modern principles and rules of urbanisation, and that they will not be merely the result of improvidence, chance or private interest.

The congress hopes that as soon as possible laws will be passed with this object in view and determine at the same time the legal measures necessary for the practical realisation of the said plans.

2. American cities, in the development of their plans, should not lose sight of their historical past, their surroundings and customs, so as to retain the

peculiar characteristics which will make them more evocative, interesting and distinct one from the other.

3. In order that the general plans for urbanism may be successful it is advisable: that they should be entrusted to specialised official organizations, in which representative citizens may take part, but in which the majority of members should be technical experts.

4. Populous districts which are unprovided with general plans cannot dispense, at least as a measure of emergency, with the regulations for the building of new streets, residences, suburbs and private allotments. Among the chief points in these regulations the following should be noticed:

- (a) In new allotments a minimum of 10% of the total area ought to be reserved for squares, gardens and playing grounds.
- (b) In the urbanisation of suburban residential areas it is desirable that building lots should be given dimensions which will allow buildings to be at some distance from the frontage and sufficiently separated from the neighbouring buildings.
- (c) The rational placing of buildings not essentially residential should be decided upon: hospitals and schools should be conveniently distant from the frontage of the plot and situated in quiet roads; buildings of a civic character should be placed preferably at central points; shops, garages, etc., along business thoroughfares or at points where they cross each other or in the squares; cemeteries in the more isolated and little frequented parts.
- (d) Before any new allotment is sold the services of urbanisation such as: water supply, drainage, paving, lighting, etc., should be installed therein, or at least guarantee given that they will be installed at the earliest opportunity.

5. The congress expresses the hope that the municipal authorities will regulate with all urgency the construction of sky-scrapers, taking into consideration light, ventilation, aesthetics and urban perspective, it being considered advisable that plans be submitted to official commissions appointed to study the aesthetics and endowed with effective powers, at least of veto. In particular, architectonic treatment of all normally visible outer walls should be insisted upon.

Professional Regularization and Patent Rights of The Architect

CONCLUSIONS:

1. That the public authorities of all the countries of America should sanction laws with a view to regulating the position of architects who hold a specialized diploma conferred by official or recognized schools where there is a special course of architecture, precisely defining the qualifications of such professional men according to whether they practise as architects or builders.

2. That, with reference to artistic property, these public authorities should pass new laws or reform already existing ones, with a view to guaranteeing patent rights to architectural works, and establishing clearer rulings relative to this art, as juridical codes, conventions and opinions only treat the matter in a general way, including it with other arts and literature.

3. That these legal rulings should be adjusted in

agreement with the suggestions made by the permanent committee of international artistic congresses.

4. That, in the absence of such laws or reforms, in the case of an action or law-suit, the legal authorities trying the case should, before giving a decision, ask the advice of a commission of architects, preferably elected by an association of the same.

The Organization of Public and Private, National and International Competitions in Architecture and Urbanism

CONCLUSIONS:

Considering: that the regulations for public competitions approved by the majority of the Societies of Architects in America reach a high standard of perfection, and that the failure of these in most cases is due rather to the interference of ignorant persons in their organization and execution than to the procedure established by the regulations.

Considering: that the task of the Jury involves exceptional responsibility, taking up a great deal of time, and is in its results beneficial simply to the promoters of the competition.

Considering: that the planning, improvement or enlargement of cities requires a profound knowledge of the customs, idiosyncrasies and requirements of their future and present inhabitants, as well as of other technical requirements.

Considering: that it would be advisable to standardize the directions contained in the regulations for competitions actually in force in almost all the countries of America, as this would tend to give them greater weight and to accumulate experience which could be used to still further advantage.

The IVth Pan-American Congress of Architects resolves:

1. That competitions of any kind whatever should be organized and conducted, from the organization of principles and procedure right up to the end, by one single architect specializing in this class of work and with some experience of the same.

2. That on the juries only the architects shall vote, and there should be a majority of these appointed by the promoter of the competition, only these promoters or their delegates (*not architects*) having the right to vote.

3. That the work of the members of the jury should be remunerated, and that those members who are nominated by societies of architects should give part of their fees to the latter.

4. That the societies should scrupulously insist on the strict fulfilment of all the clauses of the regulations for competitions so that they will be carried out in accordance with the same, and every precaution should be taken to ensure that this is done.

How to Judge the Tendency of Modern Architecture—Decadence or Revival?

CONCLUSIONS:

"The tendencies of modern architecture constitute the initial plastic expression of a new cycle in the adaptation of simple forms to the 'Spirit of the Age,' which should be characterized by the desire to harmonize its creations with the new materials and constructive and technical elements which progress has incorporated in the inheritance of civilization."

New Buildings for University of Montreal

ERNEST CORMIER, F.R.A.I.C., *Architect*

THE new buildings for the University of Montreal on which construction began about a year ago, are now well under way and while the complete structure is not expected to be ready for occupation until sometime during the latter part of 1932, a brief description of the project should prove of timely interest.

The site on which the university buildings are being erected was donated by the city and is located in a residential section in the north-western portion of Montreal on the north-east slope of Mount Royal. The university buildings, when completed, will cost approximately seven million dollars and will contain fourteen and a half million cubic feet, with a capacity for three thousand students. Although primarily an educational building, it will be composed of two parts, one part containing a teaching hospital with accommodation for four hundred and eight-five beds, and the other the various faculties of a university.

All buildings are connected and are grouped symmetrically around a central court of honour. The three wings shown at the right of the accompanying front view of the model, together with the connecting wing at the rear, constitute the hospital. The lower two floors and the one storey intermediate wings of the buildings are to be used for the out-patient department with direct entrance from the sides of the centre wing, while the public entrance is in the centre of the front. The ambulance entrance has been placed on the west side in order to take advantage of the slope, thus providing direct approach to the second floor. One of the features of the plan is the direct access that has been provided for the students from the medical school at the rear, to the hospital, without having to leave the building. The operating rooms, located on the upper floors of the medical building, are two storeys in height with a gallery for students protected by glass shields from the operating room

below. All teaching departments have standard units for laboratories based on twenty foot spacing. The lecture halls are all grouped in the rear pavilion and are superimposed, one over the other. A chapel has also been provided in the west pavilion.

The east side of the university buildings contains the faculty of science, faculty of dentistry and the school of pharmacy. The administration entrance is in the centre wing, while a separate entrance to each department has been provided at the rear.

Facing the court of honour is the administration building which is surmounted by a large tower rising two hundred and forty-five feet above the grade at that portion of the grounds. The shaft of the tower will contain the book stacks for the library below, while at the top of the tower there will be an observatory. A large amphitheatre, seating twenty-five hundred people, will be located at the rear of the tower, and on each side of it there will be public lecture halls.

The buildings generally are six storeys in height, but due to the slope of the ground, the structure at the rear is equal to the height of ten storeys at the front. In planning the buildings it was necessary to have a compact plan to provide access to all parts, as it was felt that many subjects taught at the university would be common to all students. Standardization has been an important factor in the planning of the building in order to take care of future extensions and expansions of the teaching departments.

Architecturally, the buildings are modern in design yet not modernistic. They have been designed from the point of view of practicability, and nothing has been done purely for the sake of aspect. The tanks for the sprinkler systems are on top of the two small towers containing the circular stairways, and these, together with the elevator pent houses, feature the design. The courts are all the same size about one hundred feet square. The

PLOT PLAN—UNIVERSITY OF MONTREAL
Ernest Cormier F.R.A.I.C., *Architect and Engineer*

FRONT VIEW

wings are forty-six feet wide with a centre corridor eight feet in width. The total length of the front elevation is nine hundred and sixty feet, including a one hundred and sixty foot entrance to the court of honour. The depth from the front of the building to the back of the auditorium is eight hundred and fifty feet. Generally speaking the buildings will be of reinforced concrete faced with light buff vitrified brick with trimmings of Mississquoi marble.

Some idea of the size of the structure may be obtained from an estimate made by the architect that forty-three miles of water pipe will be required, and that a watchman's inspection of the building will involve a travel of approximately eight miles.

In addition to the main buildings there will also be a nurses' home situated at the west end of the university, two hundred feet from the hospital, while at the east end there will be a students' building containing lounge rooms, etc. At the extreme east of the property, a stadium will be provided with a gymnasium under the bleachers, and at the top of the hill on the east side of the grounds there will be a number of small farm buildings for animals used for experimental purposes. On the highest point at the rear of the site, one thousand feet from the centre of the main buildings, there will also be a reservoir containing two million gallons of water to meet the requirements of the university and hospital.

Activities of Provincial Associations

The Manitoba Association of Architects

Secretary—E. FITZ MUNN, 903 McArthur Building, Winnipeg, Man.

The proposed amendments to the Manitoba Architects' Act, copy of which was published in the April issue of *THE JOURNAL*, were brought before the recent session of the Manitoba Legislature, and while approval was not secured for all the amendments proposed, consent was given to certain of them which greatly strengthened the position of the architects in the Province of Manitoba.

The act, previous to the recent amendments, stated that no one could practise as an architect in Manitoba unless the said person was a member in good standing of the Manitoba Association of Architects. The word "practice" has always been a stumbling block, as it was interpreted to mean a

series of commissions, meaning that one job a year would not constitute "practice." In the new amendments, the word "practice" is defined as follows:

"In any prosecution under this Act it shall be sufficient proof of an offence under this Act if it is proved that the accused has done or committed a single act of practice as an architect or has acted as an architect on one occasion in Manitoba without being registered under this Act or has done or committed on one occasion any of the acts prohibited by this statute, and the word "practice" as used in this Act shall be construed in accordance with this proviso."

The Ontario Association of Architects

Secretary—R. B. WOLSEY, 350 Bay Street, Toronto 2, Ontario.

At a special general meeting of the association held on May 11th, Messrs. James H. Craig, Toronto, J. P. Hynes, Toronto, and W. B. Riddell, Hamilton, were elected to represent the association on the first registration board, in accordance with the Architects' Act, 1931, Prof. C. H. C. Wright has been appointed to represent the University of Toronto, and another member of the board is to be appointed by the Lieut.-Governor-in-Council.

It is provided that the Board shall elect one of its members to be chairman, one to be vice-chairman and one to be secretary-treasurer. Also, with the approval of the Lieut.-Governor-in-Council, the board may make regulations for the admission of architects to practise in Ontario; prescribe qualifications and examinations for admission; fix the fees, and provide for the discipline and control of registered architects.

The act comes into force on July 1st next. In the meantime, the secretary of the association is giving information to enquirers and receiving the names of those who will seek registration, so that the necessary forms can be sent to them as soon as they are prepared.

At a meeting of the Council on the 21st of April, a letter was read from Prof. Nobbs, president of the Royal Architectural Institute of Canada, enclosing copy of draft of a document entitled "The Basis of Professional Charges," which it was proposed to publish. This matter came up again at the recent general meeting of the association, when a special committee consisting of Messrs. Cleveland, Wickson and Pearson reported that it would be unwise to publish any such document at the present time. As a result the following resolution was unanimously adopted:

"That the president of this association be requested to notify the president of the Royal Architectural Institute of Canada that the Ontario Association of Architects, while in sympathy with the idea of the gradual development of a general basis of professional charges throughout Canada, does not approve the document now proposed, and

requests the Royal Architectural Institute of Canada to withhold its publication until it has been given further study both by this Association and by the Board just appointed by the Ontario Architects' Act, 1931, and until it has been put into a form satisfactory to all parties."

An architects' advisory board has been formed, at the instigation of the Synod of the Diocese of Toronto, to secure experienced architectural advice and assistance in all Church of England building projects throughout the Diocese. The board is composed of the following members: L. C. Martin Baldwin, R. W. Catto, C. Barry Cleveland, C. C. King, Forsey P. Page, Jocelyn Davidson, Dyce C. Saunders, William Rae and H. F. Secord.

Some changes have been made in the qualifications required for admission to the association, in accordance with recommendation made by the board of examiners at the annual general meeting in February last, and the by-laws now provide that a member must be: (a) a graduate of an architectural course, with three years' experience as a practising architect; (b) a graduate, with five years' experience as a draftsman; (c) one who is not a graduate, but has been an associate for three years, with three years' experience as a practising architect or draftsman. That an associate must be: (a) a graduate in architecture, with one year's experience; (b) one who has spent three years in an architectural course, with four years' experience as draftsman; (c) one who has not attended a course in architecture, but has junior matriculation, with seven years' experience as draftsman and whose work shows required ability.

The following have been recently elected to membership in the association: Hugh L. Allward, Toronto; Harold A. Heist, Hamilton; Claude V. Hodges, Hamilton; Robert H. Macdonald, Toronto and Montreal; George A. Ross, Toronto and Montreal; W. F. Sparling, Toronto; Leonard E. Shore, Toronto (Associate) and Miss Alexandra Biriukova, Toronto (Associate).

OBITUARY

JULES F. WEGMAN, F.R.A.I.C.

After a life full of activity and real enjoyment of everything such a life had to offer, Jules F. Wegman died suddenly on April 30th last. He was born at Neuchatel in Switzerland and at the age of ten came to the United States with his father, who for many years practised as an architect in Chicago. There Jules learned the language of his adopted

THE LATE JULES F. WEGMAN
Reproduced from a group photograph taken at the Annual Meeting of the R.A.I.C. held at the Chateau Laurier, Ottawa, in February, 1928.

country and as he grew up received his early training in architecture from his father.

He spent a number of years in the office of D. H. Burnham and worked on many of the large buildings then being put up by that firm. At one time he was sent to Jerusalem to measure the city and its buildings, and from his drawings a reproduction of the city was erected for the Worlds' Fair at St. Louis in 1904.

In 1905 he came to Toronto and joined the Staff of Darling & Pearson with whom he has been associated ever since, becoming a partner in 1924. He was closely connected with the design of most of the buildings erected by the firm during that

period, particularly the Sun Life Building in Montreal on the drawings of which he worked, with short intermissions, for twenty-three years. In 1912 he was Chairman of the Toronto Chapter of the Ontario Association of Architects and early this year he was elected a Fellow of the Royal Architectural Institute of Canada.

He was born, lived and died a Swiss at heart though officially he was first a Swiss, then an American, and latterly, a Canadian citizen. His thoughts always reverted to Switzerland and he loved to talk of his beloved country and its customs. He was keenly interested in the development of the Art Gallery of Toronto, always had a great appreciation of music, sculpture and painting and was one of the earliest and most enthusiastic members of the Arts & Letters Club.

At the Club his was a familiar figure. Every day he could be seen at lunch, sometimes in the midst of some earnest discussion, but more often joking, teasing, and being teased to the accompaniment of bursts of laughter. The day before he died he sat in his wonted place for lunch, full of animation, telling of his recent trip to Europe and that same afternoon he worked as usual in the office. Early next morning he was dead.

Such was the end for which he had always hoped; working to the last, he died in harness, like his old friends and fellow artists, Holmes and Gagen. So passed a notable personality in the architectural life of Canada.

C. B. Cleveland.

H. IVAN NEILSON, A.R.C.A.

We regret to record the death of Mr. H. Ivan Neilson, A.R.C.A., who passed away at Quebec on April 26th, 1931 in his sixty-seventh year. Mr. Neilson was born at Quebec, and at the time of his death was Director of the Ecole des Beaux Arts in that City. He first studied Art at the Glasgow School of Fine Arts, and continued his studies at the Academie Delecluze, Paris and at Brussels, Belgium. Mr. Neilson was well-known as an etcher and painter of landscapes.

NOTES

The next meeting of the executive committee of the Royal Architectural Institute of Canada will be held at the office of the Institute, 627 Dorchester Street West, Montreal on Thursday, June 25th.

* * * *

Mr. Hugh G. Jones, architect, announces the removal of his office from 1411 Stanley Street, to 1515 University Tower Building, Montreal.

* * * *

Ernest I. Barott, (*F*) president of the P.Q.A.A. and Henri S. Labelle, honorary secretary, have been invited to view the work of the students of the Ecole des Beaux Arts of Montreal.

* * * *

George M. Fisk, (*M*) of Montreal was recently elected an associate member of the Royal Institute of British Architects.

* * * *

Mr. Charles A. Reeves, architect, announces the removal of his office from 107 Craig Street West to 1044 St. Denis Street, Montreal.

Mr. A. MacKenzie Brydon, architect, has moved his office from 229 College Street to 2 Bloor Street, West, Toronto 5, Ontario.

* * * *

Robert D. Kohn, of New York, was re-elected president of the American Institute of Architects at their sixty-fourth annual meeting held at San Antonio, Texas, April 14th, 15th and 16th, 1931.

* * * *

Messrs. J. H. Craig, president of the Ontario Association of Architects, J. P. Hynes and W. B. Riddell have been appointed as the three representatives from the Ontario Association of Architects on the new Architects' Registration Board for the Province of Ontario. Professor C. H. C. Wright, has been appointed to represent the University of Toronto, and another member of the board is to be appointed by the Lieutenant-Governor-in-Council. The new board will be empowered under the new Architects' Act, which

NOTES—Continued

is to become effective on July 1st, 1931, to make regulations for the admission of architects to practise in Ontario.

* * * *

The Department of External affairs of the Mexican Government on behalf of the organization committee of the VIIth American Scientific Congress to be held in Mexico City, on February 5th, 1932, has invited the Royal Architectural Institute of Canada to participate in the formation of a Canadian committee, which will be composed of representatives of Canadian universities and institutions of learning. Dr. Alfonso Pruneda, secretary of the National Academy of Medicine, is president of the Mexico Committee of Organization.

* * * *

According to a recent Canadian Press Dispatch, a woman has been given official recognition in the profession of architecture for the first time in England, through the appointment of Miss M. S. Taylor as an assistant at the School of Architecture at the Royal College of Art in London. During

the last few years a considerable increase has taken place in the registration of women students in those schools of architecture which are recognized by the Royal Institute of British Architects, and the recent appointment of Miss Taylor to an official position will no doubt lend great encouragement to other women in taking up architecture as a profession.

DOCUMENTS OF THE INSTITUTE

A complete file, containing the charter and by-laws of the Institute, list of Fellows and members, form of bequest, regulation of competitions, basis of professional practice, agreement between client and architect, and standard forms of contract, including the "Stipulated Sum" and "Cost Plus" forms, has been sent to each member of the Institute.

Additional copies of the contract documents may be obtained from the secretary, R.A.I.C., 160 Richmond Street West, Toronto 2, Ontario.

BOOKS REVIEWED

PUBLISHERS' NOTE—We wish to remind our readers that any books reviewed in these columns, as well as any other architectural book, can be secured through THE JOURNAL of the R.A.I.C. at the published price, carriage and customs duties prepaid.

ARCHITECTURAL SHADOW PROJECTION. By John

M. Holmes, Lecturer at the Architectural Association School of Architecture. Published by the Architectural Press, Limited, London. Price \$3.25.

The technique of shadow projection need not be confined to the student, for some knowledge of the subject is also essential to the designer as it provides him with a medium whereby it is possible to transform a working drawing into a semi-realistic representation.

In a very clear and concise manner, the author of this volume presents an analysis of the various methods employed in architectural shadow projection, together with a number of illustrations demonstrating those methods considered most typical.

The first and second parts of the book deal with the shade and shadows of points, lines, shapes, and forms, the third part with the shade and shadows of more complex forms, the fourth part gives a series of rapid methods for complex forms, and the last part shows methods of projecting shadows on inter-penetrating forms which are designed so as to introduce minor complexities.

This book is 9½" x 13" in size and contains 58 pages.

THE PRINCIPLES OF STRUCTURAL MECHANICS.

By Percy J. Waldram, Honorary Examiner, Royal Institute of British Architects. Published by B. T. Batsford Limited, London. Price \$4.00.

A very successful effort has been made by the author of this volume to deal with the subject of structural mechanics in simple and straightforward language. Many books on this subject have been published in the past, but what distinguishes this volume from the others is the facility of the author to make clear certain technicalities without the endless and complicated pages of formulae which students often find so heart-breaking.

The contents of the book is divided into six parts—Part I—Leverage and Graphic Statics. Part II—Beams and Girders. Part III—Walls and Foundations. Part IV—Roofs. Part V—Arches and Domes. Part VI—Columns and Shoring.

The first edition of this work which was published in 1912 was, we are told, given the distinction of having been adopted as a standard recommended text book by the Royal Institute of British Architects, and from a superficial examination of the volume, we believe it should prove very helpful in an architect's practice.

The book is 6" x 9" in size, and contains 418 pages, including a six page index.

MANUFACTURERS' PUBLICATIONS RECEIVED

THE B. GREENING WIRE COMPANY

"Metalace," a new product in woven metal, is fully described in a catalogue recently issued by the B. Greening Wire Company of Hamilton, Ontario who have recently acquired the Canadian Patent rights for manufacturing and marketing "Metalace" in Canada. The variety of purposes for which "Metalace" can be used is illustrated in this catalogue, copies of which may be obtained by writing to the B. Greening Wire Company, Limited at Hamilton, Toronto, Montreal or Winnipeg. The size of the catalogue is 8½" x 11".

INSULATION INSTITUTE OF CANADA, LIMITED
(International Fibre Board Limited)

The Insulation Institute of Canada, Limited is publishing a series of bulletins detailing the result of its laboratory research on insulation. These bulletins, which are issued semi-monthly, deal with technical aspects of the subject and give simple formulae governing the control of heat and sound by insulation. Calculations are given showing the amount of fuel required to heat an un-insulated building, and how it is possible to effect a saving by the use of insulation. Copies of these bulletins may be obtained by writing to the Insulation Institute of Canada, Limited, Victoria Building, Ottawa.

THE STEEL COMPANY OF CANADA, LIMITED

The Steel Company of Canada Limited of Hamilton, Ontario have recently issued a complete catalogue of "Stelco" products. In addition to complete information on all their products, it contains tables of weights and sizes of steel reinforcing bars, miscellaneous rolled sections, steel sheets, scale free steel pipe, lawn and chain link fencing. The catalogue is 8" x 11" in size and contains 228 pages.

THE B. F. STURTEVANT COMPANY

Two bulletins have recently been issued by the B. F. Sturtevant Company, one numbered 377 describing the Sturtevant Unit Ventilator, and the other numbered 385 describing their new line of Propellor Fans. The Propellor Fan Catalogue illustrates a number of features which have been introduced into the construction of the fan, and also contains specifications and dimensions. The Unit Ventilator Catalogue describes and illustrates in detail the new Ventilator and its method of operation, together with specifications and tables of heating capacities and diagrams showing a number of suggested arrangements for its installation. The two bulletins are of standard filing size, 8½" x 11". Copies may be obtained by writing to the B. F. Sturtevant Company of Canada, Limited, Galt, Ontario.

The Canada Life Building in Toronto offers an impressive example of careful planning by its builders and engineers. They realise that, for efficient service, nothing should be lacking which would add to the comfort and convenience of its patrons.

For this modernly equipped office building Westinghouse motors were selected to power the refrigeration machinery. Long-lived bearings, ample insulation and a sturdy frame construction, fortify Westinghouse motors and the service they render. That's why these motors will last many years and require such little attention. They fulfil every expectation of building engineers.

CALDWELL SASH BALANCES

Backed by Forty Years' Experience

Each Caldwell Sash Balance has a quality built into it that assures satisfaction, and maximum length of service.

Box frames can be eliminated, thus contributing greatly to making a building of warm construction. They also permit the use of narrow mullions and trim. Mortises can be cut at the mill to one size.

When the saving of labor and material is considered, they cost no more than ordinary weights and cords.

SINCE 1888—DARLING BROTHERS LIMITED—QUALITY PLUS SERVICE

How small is Tiny?

The "check list" will be mailed gratis.

Truly a foolish question, but is it more ridiculous than a race between a heavy dray horse and a fast, well groomed race horse? . . . In other words, results obtained by comparative tests in which the contestants are not fairly evenly matched in all respects, are just as foolish as the above question.

Particularly is this true in considering heating system performance. No less than 45 separate factors must be checked. To allow any one of them to be overlooked, forgotten or disregarded, may lead to faulty conclusion or false decision.

We have prepared a "check list" of these 45 variable factors to help you check your steam consumption figures and estimates. We will gladly send them gratis to anybody.

For your new building, specify a Webster System of Steam Heating . . . "A HEATING SYSTEM FOR EVERY NEED AND EVERY PURPOSE" . . . Webster MODERATOR System "controlled by the weather" . . . Improved Webster Vacuum System with Hylo Control . . . or the Webster Improved Type "R" System . . . Selected and specified by the leading Architects and Engineers.

Complete information and bulletins will be sent on request.

There's been a revolution in plastering systems

HAVE you heard about Tri-Seal Plastering System? It's the new and patented method of being certain of a permanently good plastering job.

It provides uniform plaster thickness over all surfaces; prevents corrosion, deterioration, lath marks, rust marks, etc.; ends waste, rubbish, and the excess plaster needed for open lath; speeds up construction time and has fire-resistant qualities higher than other combinations of materials of equal thickness.

What is Tri-Seal? It is made up of the following components, all produced under the Tri-Seal label; gypsum lath, steel reinforcing and supporting channels; securing members, base coat, finishing lime and gauging, PLUS the fact that it is only sold through dealers of recognized standing and applied by men of known skill.

The materials used are guaranteed by the makers—this company.

The use of steel channels to armour the edges of the gypsum lath is an advancement in construction methods whose benefits are easily seen. They assure perfect support and securing means for the lath and also maintain an equal thickness of plaster over all surfaces.

For specifications and fuller information regarding this new method of interior plaster finishing, write to

This One Fact Alone Commends Massillon To Your Use

National Research Building, Ottawa
Sproatt & Rolph, Architects
Angus Robertson, Limited, Contractors

Open Web Design

Electric wiring, conduit, plumbing, etc., may be placed between floors with a minimum of labor and expense, using Massillon Fireproof Floor Construction.

The open web design of these joists obviously makes cutting, drilling or suspending ceilings absolutely unnecessary.

Lightness of weight, standardization of sizes, flexibility of span, are other advantages that have helped to place Massillon at the head of the field in modern floor construction materials.

Complete information on request.

Canada's Copper Industry

From ore to finished product, Canadian enterprise has developed the Copper Industry to a self-contained undertaking within the Dominion.

As in other leading Canadian Industries, executives of Mines, Refineries and Fabricating Plants attach the utmost importance to maintenance costs.

Builds for Permanence

The selection of Murray Built-up Roofs for the Buildings of Noranda Mines Limited, Canadian Copper Refiners Limited, and the E. Phillips Electrical Works again confirms the Dominion-wide recognition of Murray Bonded Roofs as a major contributing factor to lower maintenance expense and stable profits.

For proved heating efficiency

... specify Daisy Boilers and Warden King Cast Iron Radiation

TIME has proved beyond all question the quality of Warden King heating products. Seventy-nine years ago, Warden King Limited was founded. Steadily since, it has kept the confidence of Canadian builders and home makers.

Service has proved the merit of Daisy boilers and Warden King Radiators. In 75,000 Canadian homes, Daisy Boilers are giving dependable even warmth. In actual use as well as by the most careful laboratory tests, cast iron radiation of the type so well embodied in the scientifically designed Warden King Radiators, has proved that it is more durable, sanitary and occupies practically the same space as copper or fin type of radiation used for indirect or concealed heating.

Now, both Daisy Boilers and Warden King Radiators have been improved to make them better than ever. In the boiler, inclined sections give positive circulation; grates require no bolts or pins and can be easily lifted out and replaced; extra deep fire pot satisfactorily burns soft or hard coal, coke, many grades of fuel; clinker door is arranged for easy installation of oil burning equipment; the base in one piece reduces air leakage to the minimum. In the radiators, graceful columns give a beauty that adorns a room interior while they improve heating quality.

Why take chances on claims and experiments? Specify this proved, dependable, superior heating for the houses you plan. Recommend it to your clients for modernizing. Let us send you full information and ratings for the full line of Warden King Boilers and Radiators.

+
The time-tried Daisy Boiler, now improved for still greater heating efficiency, is part of a complete assemblage of Warden King heating materials for homes, business buildings, schools, and all purposes.

+
The New Warden King Radiators, with graceful lines and slender columns. They are, we are convinced after careful investigations, more desirable than copper, fin, or any type of indirect or concealed radiation yet offered.

MODERN AS THE MOMENT

IN ANY interior—whether it be Louis XIV or a futuristic fantasy—the Copley adapts itself. Its elegant taste expressed in slender, symmetrical lines presents an effective appeal to thousands of particular people with varying opinions as to what constitutes true beauty.

In performance, the Copley excels. Designed with maximum exposure of heating surface and ingenious open spacing, it stimulates a correspondingly greater flow of air. The Copley is also for this reason much easier to keep clean.

In specifying Copley you take the fullest possible measure to please the vast majority of future occupants.

A COMPLETE LOCKER SERVICE

by

“OFFICE SPECIALTY”

THERE was a time when Club executives were inclined to look upon Lockers of “OFFICE SPECIALTY” Quality and say, “They seem to be built just a little better than necessary”—but Club executives of today are thoroughly appreciative of the fact that a long-term investment in Lockers is the best investment.

When you buy “OFFICE SPECIALTY” Lockers you get a locker room set-up that is a pride of the present executive and membership, “and a joy forever”. No sharp or rough edges to cut the fingers and tear the clothing—no unsightly gaps due to poor designing and erecting—but strong, accurately fitted doors, substantial gauge steel finely finished, secure locks, good ventilation, roominess, privacy and quiet operation.

If any other accommodations or qualities are sought, they’ll be built in to order if not already incorporated in the “OFFICE SPECIALTY” stock designs.

It will be a great pleasure to help you in whole or in part in connection with new locker requirements. Descriptive literature and all details will be promptly furnished on request.

Peterborough - Canada

SALEM ROOFS

*Texture of weathered hand-hewn shingles . . .
soft, earthy colours, harmonizing with
every architectural plan*

THERE is no obvious "newness" in a Salem Roof. The beauty of wood shingle roofs of early Colonial days, the charm of colours softened by age, blended into a harmonious relation to their surroundings, have their counterpart in the texture, the feeling of age and tradition of this newest Johns-Manville accomplishment.

In the grey shades these Salem Roofs are perfect replicas of the weathered,

hand-hewn shingles on early Colonial houses. But not by any means are these rich roofs bound by any single architectural period. Colours range from blue-black through greys, browns, greens and reds—not only solid colours, but combin-

ations in which shingles of related shades are intermingled—and give the ageless richness and interest of moss-covered wood. Write to Architectural Service, Canadian Johns-Manville Co. Limited, 19 Front St. East, Toronto.

PEDLAR TALKS
on remodelling old houses

The brains of the modern architect combined with the skill of the builder and plasterer can effect amazing transformations in old frame buildings.

Many old dwellings have ceased to be tax-burdens and have become revenue producing homes of the better type by the application of Pedlar's Truss Fabric and stucco. This reinforcing nails directly over a clapboard, or other surface. It is metal lath *corrugated*—an excellent base for the stucco job.

WIRE FABRIC

THE CHANGING SKY LINE

WIRE FABRIC

THE STEEL BACKBONE FOR CONCRETE

Triangle Mesh Wire Fabric Reinforcement. Furnished in rolls or sheets

Electric Weld Wire Fabric Reinforcement. Furnished in rolls or sheets

Nothing more strikingly typifies this new age—than the changing sky line. Old buildings are being razed—to make way for sky pursuing structures, that fill today's requirements for light, air and sanitation.

Not only is the architecture impressively different in its simple beauty, but building methods have *had* to change to make them possible; yet Wire Fabric still answers every need as it has done for over a quarter century.

In the modern skyscraper, Canadian Steel Corporation Wire Fabric is a recognized factor of safety and permanence. It assures the most effective distribution of the steel.

Information, including engineering data on Wire Fabric for concrete reinforcement, will be furnished on request.

Also manufacturers of Apollo and Apollo Keystone Copper Steel Brands of Galvanized Sheets—Tin Plates.
