# 1866 The First TRANS-ATLANTIC ...went into operation

In 1866 the first Atlantic Cable of commercial value was laid between Valentia, Ireland and Hearts Content, Newtoundland. Two previous attempts had failed due to breakages at sea. Finally, "The Great Eastern", largest ship in the world at that time, dropped anchor at Hearts Content and the link between the Old and New Worlds was complete.

# JENKINS VALVES were Juvented

Into the design and manufacture of every Jenkins Valve goes the practical experience of 73 years of valve making. The result is a product of high quality—correct in design, and sturdily made from metals of highest tensile strength. There is a Jenkins Valve for practically every purpose—a valve that provides the long, dependable performance that industry demands.

HELP TO MAKE THE HOME IMPROVEMENT PLAN A SUCCESS BY SUP-PORTING ITS ACTIVITIES

# FIRST THINGS FIRST

# GOOD HEATING FOR GOOD BUILDINGS

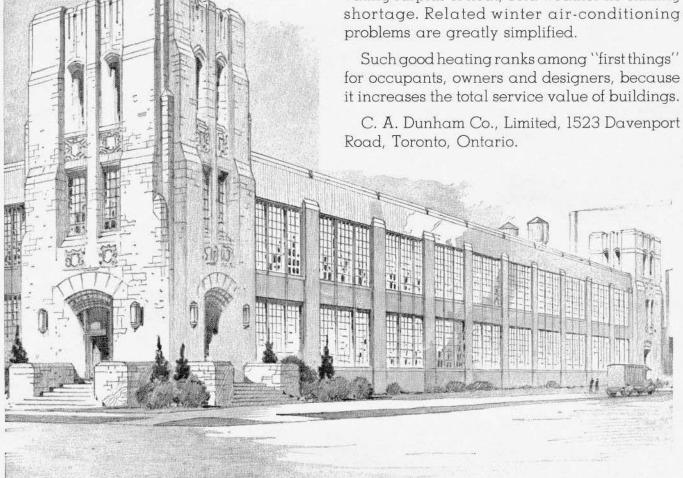

**DUNHAM** DIFFERENTIAL. **HEATING** 

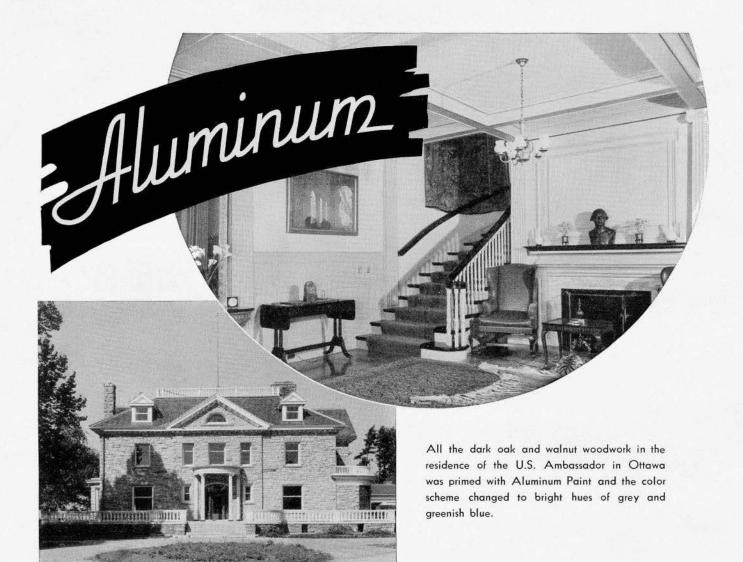

A good building may impress the passerby with its grace and implicit fitness to function. Inspection may well enhance such casual good impressions. Yet unless the building has good heating, it will fall short of full service to its occupants and thus to its owners.

First things first! Heating comfort is imperative if good architectural design is to express itself fully in human satisfactions.

Dunham Differential Heating keeps good buildings comfortable. During the long months of the heating season it distributes sub-atmospheric steam ("cool" steam) continuously but at rates which vary imperceptibly with the need for heat. Mild weather brings no enervating surplus of heat, cold weather no chilling shortage. Related winter air-conditioning problems are greatly simplified.

for occupants, owners and designers, because it increases the total service value of buildings.

Because of its durable priming qualities, Aluminum Paint was selected for the priming on this renovation job. The opaque coat of Aluminum makes the ideal base for the application of the finishing coat, as it resists moisture and retards swelling and shrinking of the wood.

"Alpaste" Aluminum Paint has a high reflectivity and is extensively used for inside painting of factory buildings to improve illumination. Write the Company at Toronto or Montreal for detailed information.

# Architectural CONCRETE

## for the modern Church

Monolithic construction means unusual economy. One material, concrete, in which permanence and fire-safety are inherent—serves as both the structural and the architectural medium. Design is completely liberated and the intricate detail traditional to church architecture is molded into the structure at minimum cost. Walls, floors, stairs, beams, roof, dome or spire are one homogenous mass of unyielding strength. Write for free Information Sheets and the manual "Forms for Architectural Concrete". They will assist you in designing concrete structures. The beautiful monolithic structure shown here is St. James Church in Vancouver, B.C.

# The TREND is toward ASPHALT SHINGLES

Surveys and sales show clearly that the trend is toward asphalt shingles for roofing Canadian homes.

Only a few years ago, home-owners had to choose between roofs that were almost prohibitive in cost and required extra heavy construction or shingles that were inflammable.

Barrett Shingles have solved the problem 100%. When you select Barrett Shingles you get an attractive, colorful roof plus fire-safe, weather-tight, long-lasting protection . . . all at a cost within the most limited building budget! Write our nearest office for descriptive, illustrated booklet today!

# A COMPLETE HOME HEATING SERVICE Guaranteed by Imperial Oil

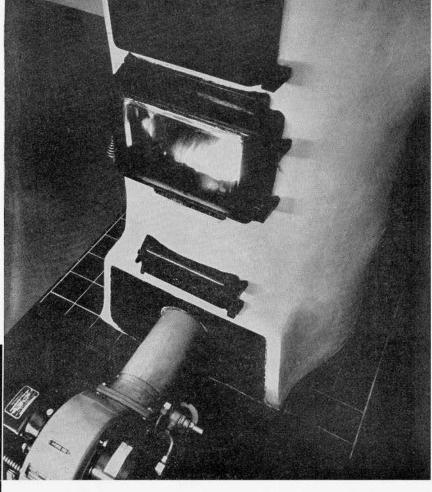

Let Imperial Oil take the entire responsibility for heating your home. With one simple transaction you can assure yourself of clean, automatic, even, healthful oil heat—at a touch of your finger. You have only one organization to deal with for oil burner, for service, for furnace fuel oil. The reputation of Canada's oldest and largest oil company is your assurance of complete satisfaction. Imperial Oil cannot afford to sell anything but the best.

Right—Imperial G & B Oil Burners will fit any furnace, heat any home.

The famous "Flexible Flame" is adjustable to both size and shape of any fire-box and thus assures most heat per dollar.

Below—The Imperial G & B Oil Heat Unit is the last word in oil heating equipment and is ideal for installation in new homes.

# The Imperial 3 Star Heating Plan Provides for . . . .

★ THE BURNER Imperial G & B Oil Heating Equipment is the most advanced made. There are both Conversion Burners and Heating Units in several models to meet the individual requirements of every size of home.

★ THE SERVICE Expert service men, inspecting regularly, keep your Imperial G & B equipment operating most efficiently and most economically. All models are guaranteed and serviced free for one year.

★ IMPERIAL FURNACE FUEL OIL Imperial Furnace Fuel Oil is the highest quality fuel oil made. It is delivered by a supply service which never sleeps — never lets your tank become empty — you don't even have to remember to order.

Deferred Payments Available

# To Build Lasting Good Will, Specify

# GENERAL EELECTRIC HEATING AND AIR CONDITIONING

# 1. G-E AUTOMATIC OIL FURNACE

# 2. COMPLETE WINTER AIR CONDITIONING

# 3. YEAR-ROUND DOMESTIC HOT WATER

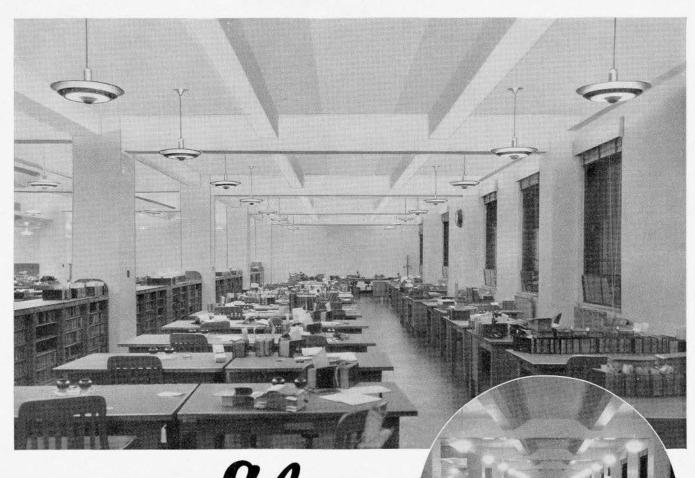

OICK acceptance—permanent good-will—these are two important advantages you enjoy when you specify General Electric Oil Heating and Air Conditioning Equipment.

The G-E Oil Furnace is one complete, compact, co-ordinated unit—guaranteed by Canadian General Electric. Owners report that its efficient design saves 12% to 37% on fuel bills. In addition, it provides plenty of domestic hot water the year 'round at exceptionally low cost.

With General Electric Winter Air Conditioning, the air is properly heated and humidified—cleaned and circulated. It ensures a comfortable indoor atmosphere—more healthful living—and greater protection for fine furniture.

# INTRODUCING Silvay THE NEWEST... INEXPENSIVE...

# INDIRECT LIGHTING

• Architects, builders and owners are welcoming SILVRAY UNITS which bring beautifying, sight-saving, indirect lighting within the price limit of the most modest estimate. Everyone agrees that modern indirect lighting is the ideal type of illumination. Everyone can now benefit by this attractive and efficient form of lighting—at a new low cost.

THE NEW SILVERED BOWL MAZDA LAMP is the secret of the economy and efficiency of SILVRAY LIGHTING UNITS. The bowl of the lamp itself acts as the dust-proof, long-lasting reflector. Installation and maintenance costs are drastically reduced. There are attractive SILVRAY UNITS for every home or commercial need. Made and sold in Canada by Amalgamated Electric. For complete information get in touch with any branch.

● THE MODERN BEAUTY of Silvray Indirect Lighting complements architectural skill. The large photograph above shows the material improvement in appearance and in business efficiency achieved when SILVRAY UNITS were installed in the offices of the Brooklyn Edison Company. The former system (in circle) delivered an average intensity of 5 foot-candles of light, with sharp shadows and glaring bright spots. The Silvray installation (above) using the new Silvered Bowl Mazda Lamp, provides 18 foot-candles of light without glare or shadows.

AMONG THE MANY new Silvray users are: Radio City, New York; Standard Oil Company; Johns-Manville Company, and the Chase National Bank.

Illustrated literature on SILVRAY—the newest type of indirect lighting—will be supplied on request,

# CREATIVE ARCHITECTURE

BY EMILE VENNE, M.R.A.I.C.

Architecte diplômé par le gouvernement français. Professor of Architecture-Ecole des Beaux-Arts, Montreal

N WHAT could modernismus find a more adequate expression than in domestic architecture? Should not the houses of today be built according to the ideals of today? Have we not now, needs, habits of life, cravings for comfort different from those prevalent—I would not say a century ago, not even fifty years ago—only three decades past? Nobody would venture to say: No! Setting these questions is answering them.

Where, more than in our country, should a characteristic ideal of architecture have developed? We were in a privileged condition to do it, but we have not. Our whole history, our whole life is one of pacific conquest of a great land, and of a particular climate. Had we expressed our battle against the land, had we solved the problems that our winter presents, Canadian architecture would mean something. We have known of the discoveries of the world and have used the inventions of our neighbours. Commodities, appliances, materials have been utilized by us without great ingenuity. The solutions to our problems are not adapted.

Why? Probably because we have not as yet formed an ideal of our own. Too many and too divided there exist European ideals, American ideals, etc., among our small population of ten million souls throughout the Dominion. We need a Canadian ideal to create an architecture.

I hope I do not have to explain, when I mention the non-existence of a characteristic Canadian architecture, that I intend in no way to discredit what has been done in this country as a whole, or in part. I only want to state that we have not contributed specifically to the architectural wealth of humanity, even if here and there we know of buildings or houses intelligently and skilfully planned, designed and executed. But, as the actual trend is towards modernistic expression, is it useless to try and suggest a higher target? I expect not. And this is why I will attempt to examine conditions of a veritable modern expression. I know that in a short paper, I shall but scratch the surface. Let another, or many others more qualified, go farther, and do better.

Architects do know very well they are in no way responsible for all that is done in building. Particularly when that building is a house. In domestic architecture two parties are involved: first, the client (who, very often, is a numerous party), second, the architect. The result is always a compound of caprices, freaks, partial knowledge, curious ignorance, character, particular habits and

financial possibilities of the first party, with the knowledge, the ideals, the science and the character of the architect, the second party. In domestic architecture one master exists: the client, towards whom the architect has one duty: satisfy his needs with his means. This is the "raison d'etre" of the architect, and sometimes it is tragically tyrannical. So, in domestic architecture the final result is not the work of the artist alone. The solution of such problems has then a social side. It cannot be only what we want it to be. The laymen's educational limitations dominate the situation.

In apartment houses where the first thought of a proprietor is expected profits, the problem happens to be, in numerous cases, exceedingly difficult for one who contemplates the expression of an ideal of beauty. Such buildings, generally, are at the same time too small or too large to permit a real and effective design. Recent buildings of this type in Europe, particularly in France under the H.B.M. plan, express some fairly good solutions. governments would render a grand service to the cause of architecture in sponsoring similar enterprises in this country and far better results could be obtained than with the proposed plan of building small houses for which efforts have been spent quite uselessly (architecturally speaking); for, in the study and execution of large units, collaboration of a certain number of architects would permit the creative invention of large and inspiring apartment blocks in our cities and thus furnish a basis for future research.

"A new era has begun." Those conceptions of small houses for every man appear as ideas of past ages, ideas of peasantry. Farm houses are isolated in the landscape, but cities of today must be composed of large, balanced and beautiful buildings where comfort can be given at small cost to the utmost number of people. In Canada, a young country with vast spaces, where the only thing we have is the future, we adopt a scheme of the middle ages: small houses, village houses! And we imagine that is architecture.

Architecture is a conception of greatness, a solution beautiful and joyful in the distribution of space. Having a new country to build, our solution could be an example to the world. Instead, we try to copy the little cottages of Belfast, Dublin or of the suburbs of London. And, when we modernize, we attempt to copy some of Le Corbusier's organ-

Le Corbusier, 1924.

ized conceptions, extraneous to our character, our climate and even to the true possibilities of our proper materials.

In attempting the latter many think they are modernizing. We want to be modern. There is no choice to be made. We have to be modern. But I fear we do not know exactly what this means. Being "modern" is doing creative work. How many of us moderns are more than some sort of "Renaissance architects," duplicating not only the antiquities, but other countries' creative works?

Real modern production expresses modern personality with modern means. Personality is you, or else it is I. Your personality is bound to influence yourself and others. We might not all be in accord, for personality while pleasing a few, may adversely affect others. There is no harm in that. In this age we expect personality and crave for it. Experiments are needed. They might offend, they might grip the nerves, it does not matter, we must experiment if a solution, a new "classical" solution is to be formulated. Ahead, farther ahead. Even a blunder in such cases attains a high value. Knowing what "not to do" is oftentimes the best thing to know. So experiment, if your client is willing, if he has the intelligence to let you try to the utmost of your talent, your science, your ingenuity, your love of beauty and the splendour of your ideal.

Let us copy no more, and in our efforts to create let us beware that we do not fall successively into all the blunders that classical architecture has learned to avoid.

And all of this because:

First: If there is one condition essential to the giving of value to any work of art so that it can expand and endure, it is when it expresses at the same time the character of the country and the epoch of its production, possessing at the same time enough generality to be understood and admired by the greatest possible number of dissimilar men. Accordingly, it must proceed both from social tension and social release. It has to be new in fact, and yet keep within the balance of scientific knowledge. The true gauge of its production can only be one where release and tension are in a certain state of equilibrium.

Second: We are living in an age of transition. In other words we are living in a creative period, a period when humanity revises ideals. Men feel acutely the imperfection and relativity of their intelligence and of the means they have to express themselves. In such periods, men seek always to surpass themselves, they test the impossible and try to express the inexpressible. Such periods compared to classical ones are like disease compared to health. But, particularly during periods of decadence and disease, the human soul has the best notions of the impossible and of the inexpressible. And so, it is during those times that we seek to evade nature, feeling only our inherent weakness and over estimating our veritable strength and power of a possible and indefinite development.

Classical periods, on the contrary, being of logical and robust vitality do not create. Success does not ask for further effort.

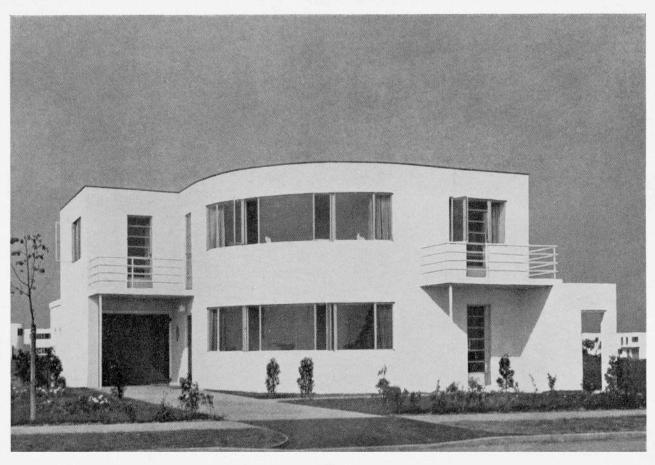

\* \* \*

Nowhere, more than in this country where much is yet to be done, should such inventive mentality exist. In my opinion it does exist. But we have up to now feared to try our wings. We have traditionalists and modernists, but both groups content themselves in following the path of European or American architects, new trails are not our present lot. Either we follow tradition too closely, or we break too brutally with it.

\* \* \*

I have tried to show the higher ideals and the conditions of invention. Perhaps I would have done better in studying more materially our actual productions. However, many others will do that, and I do not think it amiss if sometimes we look far, far ahead, and as high as possible.

We know that our personality has not found its expression. We still, in this great world, appear as copyists, even when we try "modern" architecture. This is not in accordance with a proper and justifiable conception of modernism. Just as we often repeat the forms created in previous centuries—with archaeological accuracy at times—so we repeat forms created by modernists in Europe and in the United States. What if we tried to create a tradition for ourselves, the solution of our personal problems? All architects desire it. So what? The problem is a social one and domestic architecture is social by definition.

## THE MECHANICAL EQUIPMENT OF THE MODERN HOUSE

BY MILTON S. OSBORNE, B.ARCH., M.Sc., F.R.A.I.C.

HEAD OF DEPARTMENT OF ARCHITECTURE AND FINE ARTS, UNIVERSITY OF MANITOBA

HE LAST decade has brought many interesting developments in the mechanical equipment of buildings. Scientific advancement resulting from experiment and research, the requirements of a more exacting and interested public, and the necessity of meeting the demands of the compact and simplified modern architectural styles have no doubt all combined to bring this about.

We need only compare the heating plant of a few years ago, with its exposed piping, its chains to dampers, its gauges and gadgets, with the enclosed, compact, and efficient-looking cabinets of the present day to appreciate how far we have come in the matter of appearance alone. The column radiators, protruding conspicuously into the room, were never attractive, in spite of their floral decoration. They invariably complicated the problem of interior decoration through their interference with the draping of windows and the placing of furniture. The tubular radiator has been in general use in residential heating for several years and although it is no doubt a decided improvement over the ungraceful column radiators, there has been a decided change lately in favour of convectors, usually of fin design. They are usually placed in recessed cabinets, with one or more grilles in the face or in the sill above. These are expensive, due to the necessity of providing recesses, the lining and insulating of these recesses, and the supplying of proper grilles. The design of the grilles has done much to improve the appearance of tubular radiators, particularly if their finish is in keeping with the decorative scheme of the house.

The convector depends for its efficiency on proper circulation of air, the cold air entering the grille at the bottom is heated, expands and rises up and out from the enclosure, supplying a stream of heated air. There are several types; the narrow cast iron tube radiator enclosed as a heating unit in a convector, the one with the integral cast fins set at an angle to the tube so that the fins will deflect air upward, and a third with the fins running on the sides of a high narrow chamber.

The installation and piping of the convector does not differ materially from the methods used for ordinary exposed radiators. The finished floor should run under the convector to the back of the recess, and the recess should be provided with asbestos lining and proper sides or baffle plates. The flush front enclosure, used where there is sufficient wall depth, is no doubt the most

attractive from an interior decoration point of view.

Air conditioning is the greatest development to appear in the heating world since the introduction of central heat. The air is washed, in the winter it is humidified and filtered through a close screen, which means that the proper amount of moisture is supplied to it, and finally it is circulated. Through proper air conditioning we are able to extend the comfort season through the year as well as aiding health by controlling the quality of the air in the house. In both summer and winter air motion and air cleaning should be possible, so it seems only proper foresight to plan even the simplest heating or winter air conditioning installation for eventual expansion to provide for cooling and dehumidifying.

The heating equipment should maintain an indoor temperature of 72 degrees F. in all living quarters, irrespective of outdoor temperatures, and the humidifying equipment should maintain a relative humidity of 40% indoors when the outdoor temperature is about 35 degrees if windows are single glazed, and 0 degrees if windows are double glazed. To counteract condensation on windows, it is often better to tolerate lower indoor humidity during the most severe weather. Air motion is necessary in order to insure a uniform distribution of heat. This requires some form of fan or blower equipment which is also essential to air cleaning. The temperature and air velocity should be such as to avoid drafts.

The air cleaning equipment should be able to remove dust, soot, pollen, grit, as well as smoke and odours from the air. This requires air motion and depends upon the volume and frequency of mechanical circulation and the design of the filters and washers used. The cooling equipment should be capable of lowering the temperature indoors not over 15 degrees below prevailing outdoor temperature. A greater differential is too great a shock to the human body and is, therefore, injurious.

Summer comfort may depend upon dehumidifying alone, or cooling alone, or by both in varying proportions. Automatic control of heating, cooling, and air conditioning are essential to comfort, for it is beyond the skill of the average person to control heat variables to maintain comfort conditions even if convenience and economy of operation were not considered. There should be control of all equipment with the minimum of attention

so that standard conditions will be maintained, regardless of outdoor conditions.

There are many ways to accomplish the desired results in heating, cooling and air conditioning. Warm air heating with ducts used for distribution from a central source is readily adaptable to all year round air conditioning, because its prerequisite is the circulation of air from a heated space where it can easily be treated as desired. A warm air heating plant with forced air circulation may be converted into an air conditioning plant through the addition of air washer, filter, humidifier and fan. Such a system furnishes warmed, humidified, cleaned air through individual ducts to every room in the house. It is limited, however, if the plan of the house requires excessively long ducts. Individual vents are provided from kitchen and bathrooms; with the exception of infiltration losses the remainder of the air is carried back to the plant to be warmed, cleaned and humidified again. The ideal arrangement is the installation of both supply and return ducts for each room, but economy usually requires the omission of some of these return ducts and the substitution of large ones at handy points. There is always the serious objection that kitchen and bathroom odours may be recirculated into the system, but by venting them outdoors this may be avoided. This will mean heat loss and higher fuel cost, which might entirely upset the advantages of the first cost of the system.

Piped heating has a number of advantages for heating, but is not so easily adapted for air conditioning. It is usually necessary to install unit blowers, humidifiers and air cleaners in each space to be conditioned. Summer air conditioning requires the use of unit coolers with their own fans and air cleaners. Some cooling may be done by piping cold water through existing radiators if the radiators are equipped with drip pans and drains to remove condensation.

A combination system suitable for large residences, schools, churches, and theatres, where intermittent heat is required, uses both direct radiation and indirect warm air heating. There is a central steam or hot water boiler connected to direct radiators where heating alone is required, and to indirect heating elements in one or more systems of warm air ducts where air conditioning is required. Service rooms, bath and garage may be heated by radiators and isolated from the return duct system where objectionable odours might be circulated. Other sections of the building might be completely air conditioned by local indirect heating units. The central plant would be used for an all year round supply of hot water or any summer steam demanded.

Special care should be taken in the selection of the equipment regarding future air conditioning requirements. The boiler should be equipped with an oil burner, gas burner or automatic stoker and should be completely automatic in operation. While the main heat source would be used for hot water supply in winter it may be impractical for such use during the summer. Steam and hot water boilers may be equipped with indirect heaters for supplying domestic hot water and both types of plants may be operated all year round for this purpose by cutting off the distribution lines in summer. The change-over is more readily made with steam than with hot water.

One unit system humidifier eliminates the system of ducts and substitutes unit conditioners or humidifying radiators, which consist of convector type radiators, a blower, filter and evaporator, all in one. They may be adaptable to existing structures where there is not too much difficulty encountered in cutting through partitions and other structural parts of the building. They are quite expensive and not generally used where a complete system can be installed. It is scarcely likely that this type of humidifier would be considered in a new house. They are attractive units replacing the radiator and look much like large radio cabinets. Control is automatic with manual selection and is so arranged to prevent incorrect combinations of air conditioning functions. They may be connected to steam or circulating hot water for heating and humidifying purposes.

A portable type of air conditioner has a water cooled condensing unit enclosed in a steel, soundabsorbing case and a cooling unit with fan, all mounted on a common base with rubber-tired wheels and enclosed in a very decorative steel cabinet. There is an electric cable for plugging into a light circuit and a flexible hose or copper tubing for connection with the water supply and drain. Special precautions must be taken to avoid scaling up of units due to impurities in the water.

Many of the modern units are attractive, neat and compact pieces of home furniture. The controls are enclosed, the cabinets shaped much like a large trunk, finished in attractive colour combinations. They should not in any way detract from the appearance of a children's play room, a recreation room for adults, or a store room.

One type is "encased in a cabinet of heavy 20 gauge, cold-rolled furniture steel in glossy, two-toned green enamel, corners are gracefully rounded and proportions have been carefully balanced. Valves, piping, motor and controls are concealed, yet are readily accessible through large, removable panels." One company claims compactness, reduced weight, improved appearance, reduced possibility of leaks, visible refrigerant check, quiet, vibrationless mechanism, and accessibility.

A new summer air conditioning equipment to be put on the market soon, guarantees a saving of from 15 to 25% on installation. It uses water as the primary cooling medium. A compact, high efficiency indoor cooling tower keeps water consumption well below that required for ordinary water cooled refrigerator condensers. A reduction in water costs of over 90% is claimed in test installations as compared with standard refrigerator equipment. It is estimated that summer cooling for an ordinary house will cost less than \$1,000.00, and have a seasonable operating cost of \$25.00 to \$35.00.

The design of the mechanical equipment of the modern kitchen has evolved far from the days of the hand pump in the corner, the black, sooty range, and the cast iron sink. Enamelled units trimmed in stainless steel so designed that they fit into a compact related group, have been on the market for several years and are continually in the process of improvement.

There is a very interesting article in the "Architectural Forum" April, 1937, on the "Integrated House" that presents some ideas on mechanical equipment well worth considering. Quoting: "The development of such equipment (furnace, refrigerator, bathroom and kitchen equipment) was until recently a predominantly unit-by-unit development. But as the development of individual units has become more and more perfect, the contrast between individual units and their effect in combination has become steadily more evident. The inevitable result of this process has been the introduction of integrated equipment. Integrated kitchen equipment, which starts merely as a redesign of typical kitchen fixtures for better use together, invariably soon involves the incorporation in the various units of parts formerly belonging together, and separate units." The article goes on to suggest that these varied prefabricated units might easily be developed into a "completely integrated and prefabricated mechanical power plant for the modern home." The bathroom and kitchen fixtures as well as water heater, heating, and ventilating equipment would require only soil and vent lines, water, gas and electrical connections to be ready for use.

The designing and location of the kitchen equipment may make or mar the effectiveness of the kitchen as a working machine. The house plan will determine the location, size, shape, and peculiarities of doors and windows and it is there that we find the difference between awkward, unworkable, kitchens and pleasant, convenient ones. The planning of the kitchen will not be considered in this discussion, let us say only that the various units must be arranged in proper work sequence, the work moving from left to right or right to left, depending upon the location of the dining centre, the outside door, and access to stored food supplies. The U-shaped kitchen is generally con-

ceded as the most convenient in which to work and is especially advisable in apartments or small homes where there are few in the family. Arranged in normal sequence, kitchen operations are: receiving supplies, storing supplies, in cabinets or refrigerator, preparing and mixing foods, cooking, serving, cleaning up, replacing food and dishes in their proper storage space. It naturally follows that the kitchen equipment must be so placed as to allow each operation to be done most easily and quickly.

Counters may be used for work centres and part of the space beneath used for the storage of utensils and supplies. Knee space should be allowed under the sink and work counters, and a space recessed under all cupboards that come flush to the floor. cupboard doors should not be too wide and the cupboard tops should be low enough to be easily cleaned or the ceiling should be furred down to their tops. The cabinets of the kitchen recently shown by a well known manufacturer have nonpanel doors, with metal bar handles and are recessed at the base for toe space. The counters may be of a number of materials, their order of cost being stainless steel, monel metal, porcelain, linoleum, maple wood, pressed wood.

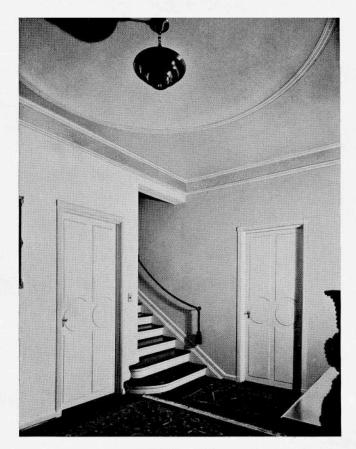

The new refrigerator has shallow shelves to avoid a long reach. The shelves are not uniform, but divided into compartments, one much colder than the other, for meats, eggs, etc. and the other less cold, for vegetables and fruits.

The kitchen sink has the back splasher cut down to six inches to provide for a lower window and allow better light and outlook. There is an increasing demand for the double-bowl type, one bowl the usual depth and the other twice that. The deeper one is provided with a large wire frame for stacking dishes for drying. Cabinets underneath help in looks as well as convenience, one side fitted with shelves and the other holding the drain pipe with room for miscellaneous cleaning materials.

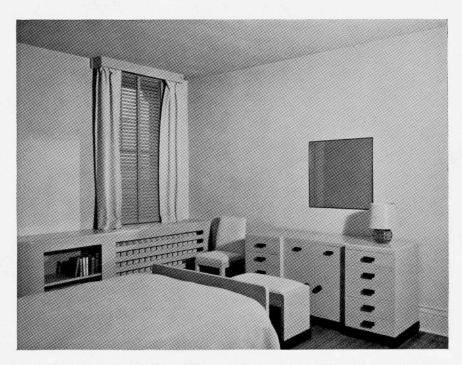

The kitchen range is a most attractive adjunct to the modern home, with chromium and blue and scarlet trim. There is ample space on the burners for large pans and skillets and some have removable plates or platters that can be taken to the table. The stove reaches to the floor with space beneath for pot and pan storage. There is an automatic oven control, a thermostat and a clock-operated heat starter and shut-off.

There are all manner of attachments for the food mixer that will mix cakes, shred vegetables, extract fruit juice and polish silver.

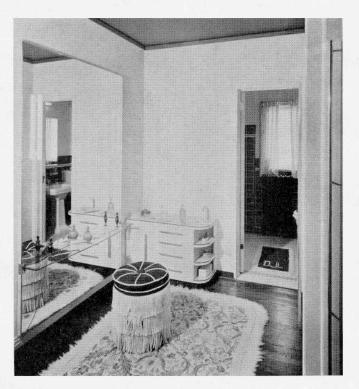

There is no longer room for complaint on the part of the architect that the mechanical equipment of the house detracts from its beauty, for the manufacturer has met the demands of a mechanical age in combinations of beauty, utility and efficiency that have never before been equalled.

MODERN BATHROOM IN A TORONTO RESIDENCE

# PLANNING THE MODERN BATHROOM

BY B. EVAN PARRY, F.R.A.I.C.

LANS and details of a bathroom in a set of house plans demand more lines per square inch than any other unit. There is every reason to suppose that if a bath manufacturer conducted his business as does an architect when drawing the details for a bathroom, the former would not sell a stock product from his warehouse but would make a special bath, W.C. or lavatory basin 1/2" wider and 3/8" longer than the previous one made. Result-monetary loss to all concerned. Based on this premise, surely it is possible for architects to start with certain stock bathrooms when the house is first being planned, and treat this space with the same respect which is given the space allotted for a car in a garage, a bed in the bedroom, or a range in the kitchen. There are many types of bathrooms which could be boiled down to stock plans and no end of time and trouble saved in the draughting room. (See illustration page 91). This particularly applies to houses costing fifteen thousand dollars and under. After all, architects have no objection to using stock fixtures, why not employ stock overall dimensions?

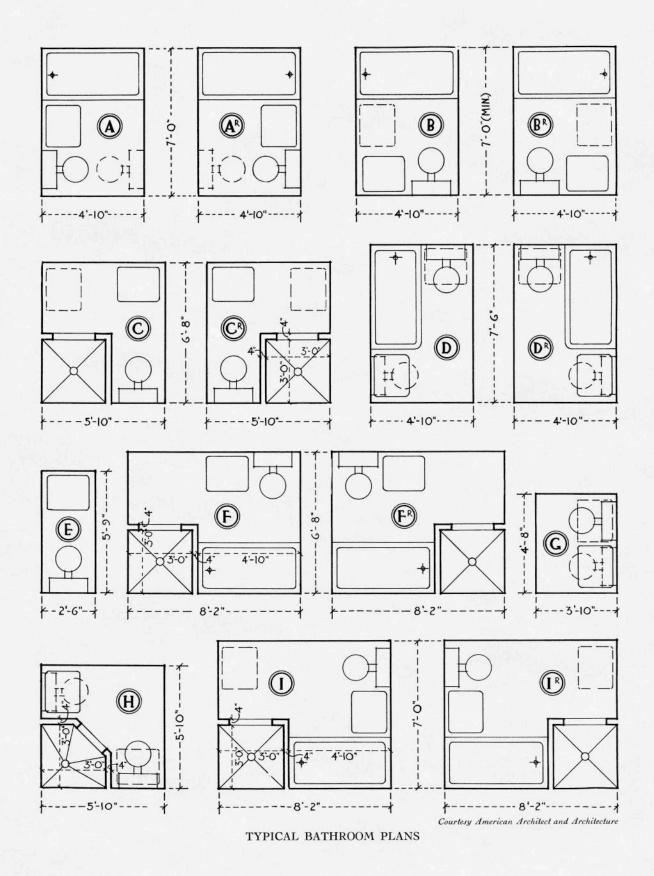

It is a truism that a bathroom placed over a kitchen very often determines where the second floor hall shall be, as also the stairs. Most of us will agree that the greater the excellence of a house plan, the smaller its second-floor hall.

In practice one sometimes plans a bathroom between two bedrooms each of which has a door leading into the bathroom. This arrangement emphasizes the problem of how to make the person leaving the bath remember to unlock the other door. There is an opportunity here for the development of some simple automatic device which would lock and unlock both simultaneously. This could be done electrically.

The Pullman car has a lesson for architects in the arrangement for plumbing pipes wherein the toilet is placed at a 45° angle because of the limited space, which in the case of a house affords space for the pipes and enables the fixture to be placed nearer the corner of the room than if the toilet were at right angles. The minimum size for any bathroom is 5′ 9″ x 4′ 10″.

There is one valuable amenity in the basement often lost sight of and that is toilet accommodation which would include a shower bath, lavatory, and toilet. Such provision for a family with growing boys is invaluable.

There are one or two details which to the experienced architect are common practice, but which may be worth noting, i.e.—never place a window

over the bath unless there is absolutely no other location possible. If a window must be there, it is preferable to make it a casement, for when it sticks, as it is almost certain to, it is easier to push or pull open than to lift the window as is necessary with a double-hung sash. Where there are children one sometimes hears of Peggy locking herself in and the fireman or policeman is called to release her. The old Colonial house which had a latch and a bolt on the inside well above the reach of children solved this problem in a very simple manner. Mouldings are "de trop" in a bathroom as in a hospital. Doors should be perfectly flush on the inside and trim eliminated. Sound-proofing is well worth while. Ceramic tile is the most practical for floors. Marble, structural glass or synthetics are the best materials for walls. Lighting within the last few years has been developed in a most amazing manner, especially in bathrooms, such as indirect lighting in a ceiling panel, adjustable and semi-indirect vertical lighting units at the sides of the medicine cabinet mirror, horizontal semi-indirect lighting tubes for the top of the mirror, moisture-proof bulbs in the tub-shower recess, and an ultra-violet ceiling fixture.

Harking back to standardized units, no longer do architects await with fear the delivery of a bath which they felt would be longer than the size they had allowed for. It is now ordered by number which remark also applies to all the fittings, and further no longer is the short-sighted bather handicapped in the effort to decipher which is the hot or cold faucet, since such things are now made of different colours.

Mr. J. B. Priestley's (the well known author) bathroom in London, England is of a most unusual type, but has its points in that the W.C. and shower placed on either side at the bottom of the bath is screened by curtains giving the privacy desired. The Alpha and Omega of bath design is the "five purpose" bath developed in England. This bath is designed to provide full bathing accommodation in houses or flats in which there is no bathroom or no space in which to make a bathroom. It can be used as a sitting bath for an adult or child, a wash basin for hand use or light laundry articles, a kitchen sink with draining board, a home laundry fully equipped with wash board and wringer, and a strong table for meals or kitchen use, ironing, pastry-making, etc.

# PLANNING THE MODERN KITCHEN

BY B. EVAN PARRY, F.R.A.I.C.

NY plan of a kitchen which disrupts the three major work centres by door space, breakfast alcove, storage closet or any other element not constantly used in food preparation, is faulty. If work centres must be physically separated, their relative location should be such as to allow a natural sequence of activity from storage and preparation, through sink and cleaning, to the cooking and serving centre. Plans based on these principles demonstrate efficiency.

Do not make the mistake of thinking that there is an absolute relationship between space requirements and food service loads, because there is not, if a case in point is required, take the Pullman car kitchen. Solutions to kitchen planning today are largely subject to standardization within definite limits. Work centres with suitable equipment form planning units of standardized character and dimensions and all the architect need do is to organize them effectively to create a kitchen that will work well in practice.

Permanent tenure of houses is a thing of the past and most houses are subject to resale at any time. Therefore, kitchens should be planned for normal, rather than special needs to make the house saleable to any buyer when necessary. It is generally better to relate the size and equipment of a kitchen to the size of the house than to special requirements—real or imagined—of its first owner. Short cuts to arrive at any conclusion are more often than not dangerous, but on general principles the size of the kitchen may be determined as follows: i.e.—The number of bedrooms plus three will determine the number of persons to be served. Space for major equipment elements can be taken as for refrigerator, two cubic feet per bedroom, plus one to two extra cubic feet of refrigerator capacity. Wall cabinet storage calls for approximately six square feet of shelf area per person, including guests. Capacity of ranges varies widely, and no scientific basis exists for fixing the cooking capacity of a range within such limits as are of practical application in residential kitchen planning. The size of the sink space can be calculated as four or five lineal feet, including the work top, this applies even for small kitchens. Greater length may be required up to eight or ten lineal feet, but the former is the minimum.

Although there are only three major work centres recognized in modern kitchen planning, there are six elemental work centres, i.e.—food storage; food

MODERN KITCHEN IN A MONTREAL RESIDENCE

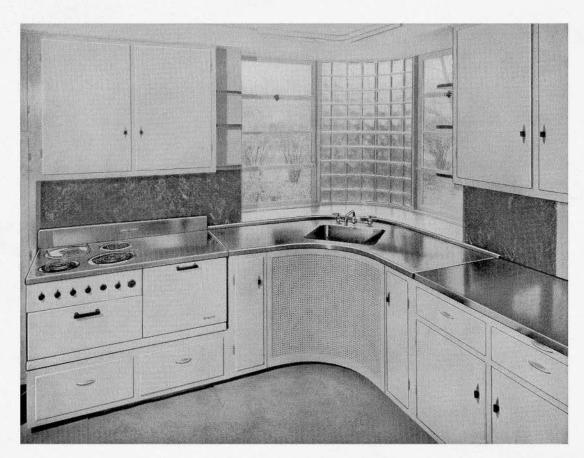

Page 93 May, 1937

preparation and kitchen cleaning; cooking centre; hot and cold food service; tableware cleaning and tableware storage. These elemental centres when reduced to three consist of food storage and preparation centre, sink and dishwasher centre, cooking and serving centre. A fourth supplementary centre can be used for tableware storage or pantry. If work centres must be physically disassociated due to the plan, it is better to keep the preparatory space near the sink rather than the refrigerator. When centres are contiguous this does not apply.

The ideal kitchen plan is a U-shaped arrangement with the sink and work top forming the bottom of

the U and the food storage and preparation centre and cooking and serving centre forming the legs of the U.

Professor H. H. Madill contends that "The most significant trend in modern architecture both inside and out is toward simplification, graceful lines and sleekness being the keynote." Further, he is of opinion that it is rather incongruous to expect that the public who demand the very latest in interior accourrements will indefinitely accept outmoded styles in their homes. This contention is well founded and perhaps applies more to kitchens and bathrooms in houses than anything else.

### NOTES

Philip J. Turner, F.R.A.I.C., of Montreal, addressed a recent meeting of the Royal Empire Society in Montreal on the subject of "The English Country House from Norman to Victorian Times."

The annual meeting of the Toronto Chapter, Ontario Association of Architects, was held at the Arts and Letters Club, Toronto, on May 14th, 1937.

\* \* \* \*

Ian T. Archibald, M.R.A.I.C., and H. P. Illsley, M.R.A.I.C., of Montreal, announce that the name of the firm of John S. Archibald Associates, Architects, under which heading the practice of the late John S. Archibald was continued, is now changed to Archibald and Illsley, Architects.

\* \* \* \*

S. H. Maw, M.R.A.I.C., of Toronto, is at present in Europe, having attended the recent Coronation of His Majesty King George VI.

The next annual British architects' conference will take place in Leeds, England, from June 23rd to 26th, 1937. Members of the R.A.I.C. who expect to be in England at that time are invited to attend the conference.

\* \* \* \*

R. R. Tourville, M.R.A.I.C., and Lucien Parent, M.R.A.I.C., announce that they have formed a partnership under the name of Tourville and Parent, Architects. Their address is Room 509, 10 St. James St. West, Montreal.

\* \* \* \*

Contracts awarded for all Canada during the month of April amounted to \$24,426,600, the highest monthly total since November, 1931. This is an increase of 52.3% over the March total of \$16,058,100 and an increase of 149% over April, 1936, the total for that month being \$9,815,100. For the first four months of 1937, contracts awarded amounted to \$55,835,700 as compared with \$41,942,300 for the same period of 1936, an increase of 33.1%.

A. W. Davison, M.R.A.I.C. and Harry P. Smith, M.R.A.I.C, of Brockville, Ontario, announce the formation of a partner-ship under the firm name of Davison and Smith, Architects.

Philip J. Turner, F.R.A.I.C, of Montreal, delivered a lecture on "The Abbey, the Empire's Shrine" at a meeting of the Westmount Rotary Club, on April 28th, 1937.

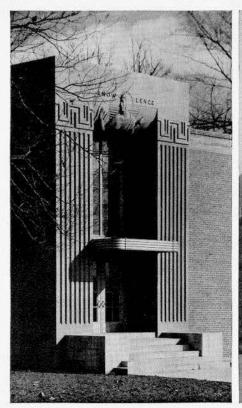

Sir Raymond Unwin, LL.D., past president of the Royal Institute of British Architects was invested with the Royal Gold Medal for architecture, at a meeting of the R.I.B.A. held on April 12th, 1937. Sir Raymond is the first town-planner to receive that distinction in the ninety years that it has been awarded.

Mr. H. S. Goodhart-Rendel, F.R.I.B.A., R.A.I.C. Representative on the council of the R.I.B.A., was recently elected president of the Royal Institute of British Architects in succession to Mr. Percy Thomas, O.B.E. Mr. Goodhart-Rendel is a distinguished architect, a profound scholar, and a man of influence in the wider spheres of public life. Fifty years of age, he will be the youngest architect president in the 103 years' history of the R.I.B.A. He is a grandson of the late Lord Rendel of Hatchlands, and was educated at Eton and Trinity College, Cambridge.

The Royal Architectural Institute of Canada announce that a new classification has been added to their standard filing system for manufacturers' literature. The new classification is "No. 41—air conditioning."

The Barrett Company Limited, Montreal, announce the appointment of Mr. G. H. Bartlett as vice-president of the company, succeeding Mr. L. F. Long, now in New York. Mr. Bartlett was born in Napanee, Ontario, and has been closely associated with the roofing and building supply industry for many years. He joined the Barrett Company, Limited, in 1927.

# Inside These Doors

# **HEALTH-COMFORT-CONVENIENCE**

WITH JOHNSON REGULATION

Regardless of the type of system employed in heating and ventilating a school building, proper Johnson automatic control equipment is available. The inevitable result is health and comfort for teachers and pupils, convenience and economy for operating personnel.

. . . These modern buildings at Bloomington, Ill., are heated and ventilated by "warm air blast". A Johnson thermostat in each room operates, silently and effectively, a Johnson mixing damper, and the proper mixture of heated and tempered air is carried by each delivery duct. Johnson Temperature Regulating Company of Canada, Limited, Toronto, Montreal, Winnipeg, Calgary, Vancouver.

# YOU are invited to make use of THIS FREE SERVICE TO ARCHITECTS

We have an organized service to architects that is freely at your service for consultation on all questions of paint and painting.

A fully qualified paint engineer will call any time at your convenience to discuss special paints, colors, etc. Panels will gladly be made up to show you the paints or stains as they will appear when applied.

Just write or phone the Dept. of Architectural Service, The Sherwin-Williams Co. of Canada Limited, P.O. Box 2640, Montreal.

SATIN-ENAMEL

THE WASHABLE SATIN FINISH

FOR WALLS, WOODWORK, CEILINGS,

This revolutionary new finish is an excellent example of how Sherwin-Williams keep abreast of modern decorating trends.

Semi-Lustre has a high light reflection value free of glare. Simple washing with soap and water removes finger marks, ink and other stains without dimming the colors or harmingthe satin surface. Be sure to investigate the possibilities of this modern interior finish.

THE SHERWIN-WILLIAMS CO.

SHERWIN-WILLIAMS PAINTS

# The ONLY REALLY

# QUIET

The N

The T/N is absolutely unique in design and principle. It embodies a water closet with operating tank in one piece unattached to wall. Strong centrifugal action provides unusually quiet performance. The only toilet having rim wash at city pressure. Cannot overflow. Made of heavy vitreous china, the T/N will not craze or discolour. Available in white, black or six attractive pastel shades.

Canadian Pctteries manufacture a comprehensive line of sanitary ware including lavatories for all requirements. Type illustrated is the straight front pedestal lavatory with cut corners, large rectangular basin and integral overflow.

Sanitary ware with this trade-mark is made of heavy vitreous china.

It will not craze or discolour and is impervious to moisture, acids, bacteria.

#### SECOND REVISED EDITION

# ARCHITECTURAL GRAPHIC STANDARDS

By Charles G. Ramsay and Harold R. Sleeper

57 MORE PLATES-22% LARGER-SAME PRICE

This book will prove invaluable to architects and draughtsmen because of its practicality and comprehensiveness. It contains 260 plates of details which give in graphic form a great deal of information regarding types of construction and dimensions of standard equipment used in different classes of buildings.

The variety of the subjects covered include such details as floor construction, roof construction, various types of framing, doors and windows, fire-places, chimneys, etc., also a great deal of useful information giving sizes of tennis courts, bowling alleys. hand ball courts, kitchen equipment, swimming pools, furniture, bath room accessories, etc.

The book is indexed so that all information can be found easily, and it is sure to find almost daily use in every architect's office. It contains 284 pages, and is 9½"x 11¾" in size.

Price \$6.50

All charges prepaid.

A NEW BOOK

# THE MODERN HOUSE

By F. R. S. Yorke, A.R.I.B.A.

The modern architect does not allow a preconceived idea of the appearance of the facade to interfere with the efficiency of the plan. New materials are at his disposal and he employs new methods of construction. This book outlines the requirements to be met in the new type of home, and discusses at length its several parts—plan, wall, window and roof. It is illustrated by about 500 photographs, plans and constructional details of houses by architects in Europe and America.

Price \$6.00

All charges prepaid.

#### A NEW BOOK

# COLOR IN SKETCHING AND RENDERING

By Arthur I., Guptill, A.I.A.

THIS volume was first conceived as a text and reference book for the person primarily interested in Architectural Rendering in Color. In its final form, however, while still ideal for that purpose, its scope has been so enlarged that it offers a vast fund of information on practically every phase of representative painting in water color and related media. Step by step, the text leads through particularly complete elementary chapters to later professional considerations. Every point is fully explained and graphically illustrated. Many professional secrets are revealed.

This book is probably the most comprehensive volume of its kind—surely it is the most handsome. The many illustrations in full color would alone be worth more than the price of the whole. It is indexed for ready reference.

In addition to an exhaustive text and scores of drawings by the author, the book is embellished with examples of color drawings by many well known artists and renderers.

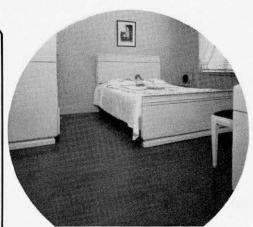

The book is 9" x 12" in size and contains 350 pages, with 250 illustrations.

Price \$10.00 - All charges prepaid

## IN THIS LIBRARY BUILT ON PIERS

Cork locks out dampness . . . aids air conditioning efficiency

More than 100,000 board feet of Armstrong's Corkboard were used in the construction of the new air conditioned Library.

This Library is built entirely on piers and it spans both a broad mill race and a traction subway line which uses the abandoned bed of an old Canal. To guard against the moisture and exposure resulting from this situation, the entire lower floor slab is insulated with 1½ inch corkboard.

In addition, maximum efficiency and economy of the large Carrier air conditioning system is assured through insulation of all ducts, air-washers and other equipment with Armstrong's Corkboard. Pipe lines in connection with this equipment are insulated with Armstrong's Cork Covering.

Thanks to the natural cell structure of cork, both Armstrong's Corkboard and Armstrong's Cork Covering provide low thermal conductivity plus a high resistance to the efficiency-destroying effects of moisture. As a result, they offer permanent insulating

efficiency for all types of air conditioned and normally-heated buildings. For small air conditioning installations, the new Armstrong's Dl Corkboard in  $\frac{1}{2}$  inch thickness is recommended. Write today for complete information and samples.

# WHAT PAINT IS CORRECT-

for a smokestack? for a laboratory? for acoustical materials?

It is not important that an architect know every answer to specialized problems. But he should know that such questions **can** be answered, and by whom.

We have prepared a manual which contains many of the answers to paint problems. It is a manual of general information and instruction. If you would like a copy, fill in the coupon below and mail to Canadian Industries Limited, Paint and Varnish Division, Toronto.

# Begin Modernization with The HEATING SYSTEM

Automatic Control will Pay for Itself

IN any modernization program, you can safely begin with the heating system. A Minneapolis-Honeywell Automatic Control system will provide the proper temperature condition so essential to health and comfort and will pay its cost in a remarkably short time by saving from 10 to 30 percent in fuel. There is a Minneapolis-Honeywell System available to exactly meet the individual requirements of any building, old or new, large or small. Electric, pneumatic or a combination of electric and pneumatic controls are possible when the system is designed by Minneapolis-Honeywell. Our engineers are available for consultation with you. They will gladly show you how little it costs to provide proper control systems for every heating, ventilating or air conditioning application.

For full information write Minneapolis-Honeywell Regulator Company Ltd., 117 Peter St., Toronto. Branches: Montreal, Winnipeg, Calgary. In England, Honeywell-Brown Ltd., London.
