Karyotypic fission theory applied. Kinetochore reproduction and lemur evolution

by R.L. Kolnicki

On page 130, "The sterility of intraspecific hybrids in crosses between *L. f. collaris* and *L. f. albocollaris* ..." should read "*E. f. collaris* and *E. f. albocollaris*". The genus name for these species has been recently changed to *Eulemur*, although some authors maintain usage of the older name (*Leumur*).

In Fig. 6, on page 133, the karyotype for *E. rubriventer* should read $50 = 14M + \underline{34}A + AA$. The box labeled "Polymorphic karyotypes generated from $34 + 30M + 2A + MA$ " lists a karyotype for $2N = 50$ that should read $50 = 14M + \underline{34}A + MA$.
